

Package ‘ArDec’

August 11, 2014

Type Package

Title Time series autoregressive-based decomposition

Version 2.0

Date 2013-05-09

Author Susana Barbosa

Maintainer Susana Barbosa <sabarbosa@fc.ul.pt>

Description Package ArDec implements autoregressive-based decomposition of a time series based on the constructive approach in West (1997). Particular cases include the extraction of trend and seasonal components.

ardec

Time series autoregressive decomposition

Description

Decomposition of a time series into latent subseries from a fitted autoregressive model

Usage

```
ardec(x, coef, ...)
```

Arguments

x	time series
coef	autoregressive parameters of AR(p) model
...	additional arguments for specific methods

Details

If an observed time series can be adequately described by an (eventually high order) autoregressive AR(p) process, a constructive result (West, 1997) yields a time series decomposition in terms of latent components following either AR(1) or AR(2) processes depending on the eigenvalues of the state evolution matrix.

Complex eigenvalues $r \exp(iw)$ correspond to pseudo-periodic oscillations as a damped sine wave with fixed period ($2\pi/w$) and damping factor r . Real eigenvalues correspond to a first order autoregressive process with parameter r .

Value

A list with components:

period	periods of latent components
modulus	damping factors of latent components
comps	matrix of latent components

Examples

```
data(tempEng)
coef=ardec.lm(tempEng)$coefficients

# warning: running the next command can be time consuming!

decomposition=ardec(tempEng,coef)
```

`ardec.lm`*Fit an autoregressive model as a linear regression*

Description

Function `ardec.lm` fits an autoregressive model of order p , $AR(p)$ to a time series through a linear least squares regression.

Usage

```
ardec.lm(x)
```

Arguments

`x` time series

Value

For `ardec.lm`, an object of class "lm".

ardec.periodic	<i>Extraction of individual periodic components from a monthly time series</i>
----------------	--------------------------------------------------------------------------------

Description

Function ardec.periodic extracts a periodic component from the autoregressive decomposition of a monthly time series.

Usage

```
ardec.periodic(x, per, tol = 0.95)
```

Arguments

x	time series
per	period of the component to be extracted
tol	tolerance for the period of the component

Value

A list with components:

period	period for the annual component
modulus	damping factor for the annual component
component	extracted component

Author(s)

S. M. Barbosa

Examples

```
data(tempEng)  
ardec.periodic(tempEng, per=12)
```

ardec.trend	<i>Estimation of the trend component from a monthly time series</i>
-------------	---------------------------------------------------------------------

Description

Function `ardec.trend` extracts the trend component from the autoregressive decomposition of a monthly time series.

Usage

```
ardec.trend(x)
```

Arguments

x	time series
---	-------------

Value

A list with components:

modulus	damping factor for the annual component
trend	trend component

Author(s)

S. M. Barbosa

Examples

```
data(co2)  
ardec.trend(co2)
```

tempEng

Time series of monthly temperature values

Description

Monthly temperature in Central England from 1723-1970

Usage

```
data(tempEng)
```

Format

Time-Series [1:2976] from 1723 to 1971

Source

Hipel, K. W. and Mcleod, A. (1994) Time Series Modelling of Water Resources and Environmental Systems, Elsevier

Examples

```
data(tempEng)
```
