

# Package ‘review’

July 2, 2014

**Type** Package

**Title** Manage Review Logs

**Version** 2.5

**Date** 2013-04-18

**Author** Tim Bergsma

**Maintainer** Tim Bergsma <timb@metrumrg.com>

**Depends** XML, Hmisc

**Suggests**

**Description** Functions for managing logs of reviews of subversioned files (<http://subversion.apache.org/>).

**License** GPL-2

**LazyLoad** yes

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2013-04-18 22:49:09

review-package	<i>Manage Review Logs</i>
----------------	---------------------------

---

## Description

Functions for managing logs of reviews of subversioned files (<http://subversion.apache.org/>).

## Details

Package:	review
Type:	Package
Version:	2.5
Date:	2013-04-18
License:	GPL-2
LazyLoad:	yes

These functions are rather flexible, but convenient defaults are chosen. Easiest usage is described here.

### Making a Log

1. In R, navigate to the check-out directory with `setwd()`.
2. Type `logCreate()`.
3. Be sure to add your log file and check it in with svn tools.

### Making Assignments

1. In R, navigate to the check-out directory with `setwd()`.
2. Try `dir(recursive=TRUE)` to get a list of possible assignments. customize as necessary.
3. To assign all files to "anyone", type `logAssign(dir(recursive=TRUE))`.

4. To assign just the files in a directory, navigate there and type `logAssign()`.
5. To review the result, type `logRead()`.
6. To undo the result, type `logRevert()`.
7. Check in your changes using `svn` tools.

### Reviewing Files

1. Update your checkout with `svn` tools.
2. Navigate to the directory containing the log, or below.
3. View your assignments with `logAssignments()` or `logAssignments(reviewer = 'anyone')`.
4. Capture the name of a particular file, e.g. `f <- logAssignments()[[1]]`.
5. To approve the file, say `logAccept(f)`.
6. Check in your changes using `svn` tools.

### Summarizing

1. Navigate to the directory containing the log, or below.
2. Type `logSummary()`.
3. If `logPending()` is empty, all assigned reviews are complete.

### Shortcut

1. Technically, it is not necessary that a file ever be assigned. The first acceptance of an existing file suffices (origin must be specified, however). The only two essential functions are `logCreate()` and `logAccept()`.

### Author(s)

---

absDir

*Absolute Directory*

---

### **Description**

Return the full path of a directory.

### **Usage**

```
absDir(directory)
```

### **Arguments**

directory      an absolute or relative path of a directory.

### **Details**

Relative paths include subdirectories, "..", ".", "~", "~/", etc. absDir() should return the complete path, back to the volume root.

### **Value**

character

### **Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [relPath](#)

---

author

*Subversion Author of a File*

---

**Description**

Gives the author of a file that is under subversion control.

**Usage**

```
author(file = logRoot())
```

**Arguments**

file            a (path to a) subversioned file

**Details**

If the file is not subversioned, NA is returned. This function is not vectorized, so use `sapply` for multiple files.

**Value**

character

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [revision](#)
- [repoInfo](#)

gmt

*Current GMT Time*

---

**Description**

Display current UTC (GMT).

**Usage**

gmt()

**Details**

sys.time() returns POSIXlt, which loses time zone when coerced to character. This function makes the necessary repair.

**Value**

character

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logQueue](#)

---

logAccept*Approve a File*

---

**Description**

Indicate acceptance of a file by logging an entry with nonzero version.

**Usage**

```
logAccept(  
  file=dir(),  
  directory=getwd(),  
  origin=logOrigin(file,directory),  
  reviewer=Sys.info()['user'],  
  force=FALSE,  
  ...  
)
```

**Arguments**

file	one or more files to accept
directory	the parent of file
origin	the file from which 'file' originates
reviewer	the user issuing the opinion, normally oneself
force	if false (default) nonexistent files cause an error
...	arguments passed to logQueue

**Details**

Can be undone with logRevert(). Calls logAppend(), which gives an error if origin is NA (default) and no precedent exists.

**Value**

(invisible) number of records created.

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logAssign](#)
- [logQueue](#)
- [logRoot](#)

---

logAppend

*Append a Review Log*

---

### Description

Add records to a review log.

### Usage

```
logAppend(new,directory = logRoot(), ...)  
logOrigin(file,directory = logRoot(), ...)
```

### Arguments

new	a data.frame of new records to append, as created with logQueue().
directory	the directory containing the log, or any directory below it
file	vector of file names.
...	arguments passed to logQueue().

### Details

Generally these functions are not called by the user. Check "see also" for preferred interface.

### Value

logAppend: (invisible) the number of rows added. logOrigin: the precedents for file origin, if any, or file itself where precedent not available.

### Author(s)

Tim Bergsma

### References

<http://metruminstitute.org>

logAppendix

*Convert a Log Summary to a Report-ready Table***Description**

Converts the output of logSummary to a Latex table, suitable for inclusion in a report, e.g. as an appendix. Gives a warning if logPending() has rows.

**Usage**

```
logAppendix(
  object=logSummary()[,c('file','revf','reviewer','time')],
  dir=getwd(),
  file=file.path(dir,'review.tex'),
  label='review',
  rowname=NULL,
  caption='Summary of file review: file, last version reviewed (revf), system identifier of reviewer, and
  caption.lot='Summary of file review',
  where='H',
  show=TRUE,
  ...
)
```

**Arguments**

object	object to be plotted
dir	a directory used to build the default file path
file	a file path for the output
label	a character string used for the tex label
rowname	default NULL suppresses rownames
caption	table caption
caption.lot	caption variant for use in list of tables
where	default H ("here") places table exactly where specified
show	default TRUE invokes the dvi viewer
...	passed to latex

**Details**

This function calls latex in package Hmisc. All arguments except dir are passed to latex. dir is just a convenience argument to place the output in other than the current working directory (using the default file name). It is ignored if file is supplied.

**Value**

used for side effects

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logSummary](#)

---

logAssign

*Assign Review Tasks*

---

**Description**

Appends a log with defaults supplied by logQueue(). These are appropriate for assignments. Default reviewer is set to "anyone". Default revision is zero, which is diagnostic of an assignment.

**Usage**

```
logAssign(file = dir(), directory = getwd(), origin = file, ...)
```

**Arguments**

file	a character vector of filenames (paths) relative to directory
directory	the parent of 'file'
origin	a character vector of filenames (paths) relative to directory, from which 'file' originates
...	arguments passed to logQueue()

**Details**

Since files with revision of zero normally do not exist, no acceptance is implied by an assigned record. This function may be used to specify a reviewer for certain files. Default reviewer "anyone" simply declares that an entity should be reviewed. "Origin" files may also be specified, indicating that a file originates from (e.g. is created by) some other file. The function logPending() identifies files needing (further) review. A file's origin is itself, by default. Currently, logAssign() calls logAppend(), which allows NA for origin (defaults to precedent or to file itself).

**Value**

(invisible) the number of records created.

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logAssignments](#)
- [logAppend](#)
- [logQueue](#)
- [logAccept](#)

---

logAssignments	<i>Detect Files to be Reviewed</i>
----------------	------------------------------------

---

**Description**

Gives a vector of the pending files assigned to reviewer (normally oneself).

**Usage**

```
logAssignments(directory = getwd(), reviewer = Sys.info()[["user"]])
```

**Arguments**

directory	the directory containing the log, or any directory below it
reviewer	a user name on which to filter results

**Details**

"Pending" has the meaning described for `logPending()`. "Assigned" has the meaning described for `logAssign()`. A character vector is returned, from which elements can be selected for use as arguments to `logAccept()`.

**Value**

character

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logAssign](#)
- [logPending](#)
- [logAccept](#)

---

logCreate

*Create a Review Log*

---

**Description**

Creates an empty table in the directory specified with name "QClog.csv".

**Usage**

```
logCreate(directory = getwd())
```

**Arguments**

directory      directory in which to create the log file

**Details**

Columns are as follows.

**file** the path and name of the accepted file, relative to the specified directory, and not beginning with "/"

**origin** identical to file or the name of some other file responsible for this content

**revf** the reviewed revision of file

**revo** the review-time version of file's origin

**reviewer** the R user name of the reviewer of file

**time** date and time (GMT) of acceptance of file

**Value**

used for side effects.

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logName](#)
- [logAssign](#)
- [logAccept](#)

---

logName

*The Full Path and Name of the Log File*

---

**Description**

Gives a full-path log name for the directory supplied. The default directory is `logRoot()`, in which case the file must already exist.

**Usage**

```
logName(directory = logRoot())
```

**Arguments**

directory      a directory for which a log name is desired

**Details**

Without arguments, returns full path to log file when current directory is at or below the root (directory containing the log).

**Value**

character

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logRoot](#)
- [absDir](#)
- [logCreate](#)

logPending

*List Log Entries that Require Review*

---

**Description**

Checks the log summary and returns entries headf > revf or heado > revo. That is, an item is pending if there exists a newer revision of its file or origin.

**Usage**

```
logPending(directory = getwd())
```

**Arguments**

directory      any directory at or below that containing the log.

**Details**

One always wants to review the latest revision of a file, given the latest revision of its origin. Typically a file is its own origin (e.g. a directly-authored script), in which case it suffices to verify that there is no newer revision. For derived objects, the latest revision of the origin is informative, and is independent of the file revision. Further review is indicated if either the file, its origin, or both have been revised. If a file has changed but not its origin, an explanation is needed. If a file is the same after a change to its origin, confirmation is needed. It is not unusual for both a file and its origin to change.

**Value**

data.frame

**Note**

Be sure to update your checkout for the latest pending information.

**Author(s)**

Tim Bergsma

- [logAssign](#)
- [logAccept](#)

---

logQueue	<i>Prepare Records for Review Log</i>
----------	---------------------------------------

---

**Description**

Create one or more records with the proper format for appending to a review log.

**Usage**

```
logQueue(  
  file=dir(),  
  directory=getwd(),  
  origin=file,  
  revf=0,  
  revo=0,  
  reviewer="anyone",  
  time=gmt(),  
  force=FALSE  
)
```

**Arguments**

file	one or more files for which to create records
directory	the parent of file
origin	file(s) from which 'file' originates
revf	the svn revision of the file being reviewed
revo	the svn revision of the origin of file
reviewer	the user issuing the opinion, normally oneself
time	character string: date and time of acceptance, using GMT (UTC)
force	if false (the default) nonexistent files cause an error

**Details**

The required format for a review log is described in [logCreate](#). Functions like `logAssign()` and `logAccept()` send output to the log. The function `logQueue()` creates a `data.frame` that can be viewed, assigned, and manipulated prior to appending the log. You may want to use `logQueue()` in conjunction with `logAppend()`. That is exactly what `logAssign()` and `logAccept()` do.

Note that time should be character, each element ending with "GMT".

**Value**

`data.frame`, with a format much like `QClog.csv`

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logCreate](#)
- [logAssign](#)
- [logAccept](#)
- [logAppend](#)

---

logRead

*Read a Review Log*

---

**Description**

Read a review log from storage and create a corresponding data.frame.

**Usage**

```
logRead(directory = getwd())
```

**Arguments**

directory      the directory containing the log, or any directory below it

**Details**

Regardless of the current working directory, if the directory containing the log is an ancestor (parent, grandparent, etc.) the log will be found and read. It is an error if the directory does not exist or if the log does not exist, or if the log is styled for package version 1.5 and earlier.

**Value**

data.frame with format much like QClog.csv

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logCreate](#)
- [logRoot](#)
- [logAppend](#)
- [logWrite](#)

---

logRoot

*Identify the Directory Containing the Review Log*

---

**Description**

This function searches backward from the current working directory until it finds the directory containing the review log. If no log is found, NULL is returned. It is an error if the directory argument does not exist.

**Usage**

```
logRoot(directory = getwd())
```

**Arguments**

directory      the directory containing the log, or any directory below it

**Details**

This is a recursive function.

**Value**

character: the full path and name of the directory containing the review log.

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [parentDir](#)
- [logName](#)
- [logCreate](#)
- [logAppend](#)

logSummary

*Summarize a Review Log*

---

**Description**

Summarize the review log associated with a particular directory.

**Usage**

```
logSummary(directory = getwd())
```

**Arguments**

directory        the directory containing the log, or any directory below it

**Details**

Whereas the review log can have any number of records for the same file, the summary reduces the data to one record per file. It is an error if any element of the file column is missing.

The log is read, then sorted on file, revision, time. The last record for each file is retained.

The function logSummary() uses the svn interface to retrieve the latest ('head') revision of each file and origin, appending them as headf and heado respectively. Column order is controlled.

print.logSummary() tries to eliminate some redundant information for easier viewing. Columns origin, revo, and heado are marked as " where non-informative, and are dropped if entirely non-informative.

**Value**

data.frame

**Note**

Be sure to update your checkout for the most current summary.

**Author(s)**

Tim Bergsma

- [logAssignments](#)
- [logRead](#)
- [logTarget](#)
- [svnDate](#)

---

`logTarget`*Generate Fully Qualified Filenames*

---

**Description**

Prepend the absolute file path to each file name, and test for existence.

**Usage**

```
logTarget(file = dir(),directory = getwd(), force = FALSE)
```

**Arguments**

<code>file</code>	one or more files for which to create targets
<code>directory</code>	the parent of file
<code>force</code>	if false (the default) nonexistent files cause an error

**Details**

This function is vectorized.

**Value**

character vector of file names

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [absDir](#)
- [logQueue](#)

---

`logWrite`*Write a Review Log to Storage in Standard Format*

---

**Description**

Write a review log, using the same formatting conventions as `logRead()`.

**Usage**

```
logWrite(x, file)
```

**Arguments**

<code>x</code>	a data.frame, like the output of <code>logQueue()</code>
<code>file</code>	a file name

**Details**

Calls `write.table()` with quotes and rownames turned off. Separator is comma, NA's are dots.

Normally the user should not have to call `logWrite()`. The functions `logCreate()`, `logAppend()`, and `logRevert()` call it.

**Value**

Used for side effects.

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [logRead](#)
- [logCreate](#)
- [logAppend](#)
- [help](#)

---

parentDir	<i>Identify the Parent of a Directory</i>
-----------	---

---

**Description**

Generate a fully qualified directory name for the parent of the specified directory.

**Usage**

```
parentDir(directory = getwd())
```

**Arguments**

directory      the directory whose parent is sought

**Details**

It is an error if the directory does not exist. If it exists but has no parent, NULL is returned. The path includes the volume root. This function is not vectorized.

**Value**

character

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [absDir](#)
- [relPath](#)
- [logRoot](#)

---

`relPath`*Create File Paths Relative to the Log Root*

---

**Description**

For the files specified by the arguments, create file paths relative to the directory containing the review log.

**Usage**

```
relPath(file = dir(), directory = getwd())
```

**Arguments**

<code>file</code>	one or more files for which to create paths
<code>directory</code>	the parent directory of file

**Details**

The elements of 'file' must be encoded relative to 'directory'.

**Value**

character vector

**Author(s)**

Tim Bergsma

---

repoInfo	<i>Retrieve Repository Information</i>
----------	--

---

**Description**

For a given file, retrieve svn repository information as XML.

**Usage**

```
repoInfo(file = logRoot())
```

**Arguments**

file            a file name

**Details**

Not normally called by the user.

**Value**

an XML representation of svn info

**Author(s)**

Tim Bergsma

---

revision	<i>Subversion Revision of a File</i>
----------	--------------------------------------

---

**Description**

Gives the revision of a file that is under subversion control.

**Usage**

```
revision(file = logRoot())
```

**Arguments**

file            a (path to a) subversioned file

**Details**

If the file is not subversioned, NA is returned. This function is not vectorized, so use `sapply` for multiple files. The file name will be single-quoted if it contains a space and does not start with single or double quote.

**Value**

numeric

**Author(s)**

Tim Bergsma

**References**

<http://metruminstitute.org>

**See Also**

- [author](#)
- [repoInfo](#)

---

svnDate	<i>Subversion Date of a File</i>
---------	----------------------------------

---

**Description**

Gives the date and time of a file that is under subversion control, with GMT as the timezone (UTC).

**Usage**

```
svnDate(file = logRoot())
```

**Arguments**

file            a (path to a) subversioned file

**Details**

If the file is not subversioned, NA is returned. This function is not vectorized, so use sapply for multiple files.

**Value**

character
