

Package ‘osrm’

April 14, 2020

Type Package

Title Interface Between R and the OpenStreetMap-Based Routing Service
OSRM

Version 3.3.3

Description An interface between R and the OSRM API. OSRM is a routing service based on OpenStreetMap data. See <http://project-osrm.org/> for more information. This package allows to compute distances (travel time and kilometric distance) between points and travel time matrices.

License GPL-3

LazyData TRUE

Imports jsonlite, RCurl, utils, stats, isoband, methods, gepaf, sp, sf

Depends R (>= 3.3.0)

Suggests cartography, lwgeom

osrm	<i>Shortest Paths and Travel Time from OpenStreetMap via an OSRM API</i>
------	--

Description

An interface between R and the OSRM API.

OSRM is a routing service based on OpenStreetMap data. See <http://project-osrm.org/> for more information. This package allows to compute distances (travel time and kilometric distance) between points and travel time matrices.

- `osrmTable` Get travel time matrices between points.
- `osrmRoute` Get the shortest path between two points.
- `osrmTrip` Get the travel geometry between multiple unordered points.
- `osrmIsochrone` Get a SpatialPolygonsDataFrame of isochrones.

Note

This package relies on the usage of a running OSRM service (tested with version 5.22.0 of the OSRM API).

To set the OSRM server, change the `osrm.server` option:

```
options(osrm.server = "http://address.of.the.server/")
```

To set the profile, use the `osrm.profile` option:

```
options(osrm.profile = "name.of.the.profile")
```

The "driving" profile is set by default and it is the only profile available on the demo server. Other possible profiles are "walk" and "bike".

A typical setup, corresponding to the Docker example, would be:

```
options(osrm.server = "http://0.0.0.0:5000/", osrm.profile = "driving")
```

osrmIsochrone	<i>Get Polygons of Isochrones</i>
---------------	-----------------------------------

Description

Based on `osrmTable`, this function buids polygons of isochrones.

Usage

```
osrmIsochrone(
  loc,
  breaks = seq(from = 0, to = 60, length.out = 7),
  exclude = NULL,
  res = 30,
  returnclass = "sp"
)
```

Arguments

loc	a numeric vector of longitude and latitude (WGS84), an sf object, a SpatialPointsDataFrame or a SpatialPolygonsDataFrame of the origine point.
breaks	a numeric vector of isochrone values (in minutes).
exclude	pass an optional "exclude" request option to the OSRM API.
res	number of points used to compute isochrones, one side of the square grid, the total number of points will be res*res.
returnclass	class of the returned polygons. Either "sp" of "sf".

Value

A SpatialPolygonsDateFrame or an sf MULTIPOLYGON of isochrones is returned. The data frame of the output contains four fields: id (id of each polygon), min and max (minimum and maximum breaks of the polygon), center (central values of classes).

See Also

[osrmTable](#)

Examples

```
## Not run:
# Load data
library(sf)
data("berlin")
# Get isochones with lon/lat coordinates
iso <- osrmIsochrone(loc = c(13.43,52.47), breaks = seq(0,14,2),
  returnclass="sf")
plot(st_geometry(iso), col = c('grey80','grey60','grey50',
  'grey40','grey30','grey20'))

# Map
if(require("cartography")){
  breaks <- sort(c(unique(iso$min), max(iso$max)))
  cartography::choroLayer(x = iso,
    var = "center", breaks = breaks,
    col = rev(carto.pal("green.pal",6)),
    border = NA,
    legend.pos = "topleft", legend.frame = TRUE,
    legend.title.txt = "Isochrones\n(min)")
}
```

```

}

# Get isochones with an sf POINT
iso2 <- osrmIsochrone(loc = apotheke.sf[10,], returnclass="sf",
                     breaks = seq(from = 0, to = 16, by = 2))

# Map
if(require("cartography")){
  breaks2 <- sort(c(unique(iso2$min), max(iso2$max)))
  cartography::choroLayer(x = iso2, var = "center",
                         breaks = breaks2, border = NA,
                         legend.pos = "topleft", legend.frame = TRUE,
                         legend.title.txt = "Isochrones\n(min)")
}

## End(Not run)

```

osrmIsometric

Get Polygons of Isodistances

Description

Based on [osrmTable](#), this function buids polygons of isometric road distances.

Usage

```

osrmIsometric(
  loc,
  breaks = seq(from = 0, to = 10000, length.out = 4),
  exclude = NULL,
  res = 30,
  returnclass = "sp"
)

```

Arguments

loc	a numeric vector of longitude and latitude (WGS84), an sf object, a SpatialPointsDataFrame or a SpatialPolygonsDataFrame of the origine point.
breaks	a numeric vector of isometric values (in meters).
exclude	pass an optional "exclude" request option to the OSRM API.
res	number of points used to compute isochrones, one side of the square grid, the total number of points will be res*res.
returnclass	class of the returned polygons. Either "sp" of "sf".

Value

A SpatialPolygonsDateFrame or an sf MULTIPOLYGON of isochrones is returned. The data frame of the output contains four fields: id (id of each polygon), min and max (minimum and maximum breaks of the polygon), center (central values of classes).

See Also[osrmTable](#)**Examples**

```
## Not run:
library(sf)
data("berlin")
# Get isochones with lon/lat coordinates
iso <- osrmIsometric(loc = c(13.43,52.47), breaks = c(0,100,200, 500, 1000),
                    returnclass="sf")
plot(st_geometry(iso))

## End(Not run)
```

osrmRoute

*Get the Shortest Path Between Two Points***Description**

Build and send an OSRM API query to get the travel geometry between two points. This function interfaces the *route* OSRM service.

Usage

```
osrmRoute(
  src,
  dst,
  loc,
  overview = "simplified",
  exclude = NULL,
  sp,
  returnclass
)
```

Arguments

src	a vector of identifier, longitude and latitude (WGS84), a vector of longitude and latitude (WGS84), a SpatialPointsDataFrame, a SpatialPolygonsDataFrame or an sf object of the origine point.
dst	a vector of identifier, longitude and latitude (WGS84), a vector of longitude and latitude (WGS84), a SpatialPointsDataFrame, a SpatialPolygonsDataFrame or an sf object of the destination point.
loc	a data.frame of identifier, longitude and latitude (WGS84), a SpatialPointsDataFrame, a SpatialPolygonsDataFrame or an sf object of via points. The first row is the origine, the last row is the destination.

overview	"full", "simplified" or FALSE. Use "full" to return the detailed geometry, use "simplified" to return a simplified geometry, use FALSE to return only time and distance.
exclude	pass an optional "exclude" request option to the OSRM API.
sp	deprecated, if sp==TRUE the function returns a SpatialLinesDataFrame.
returnclass	if returnclass="sf" an sf LINESTRING is returned. If returnclass="sp" a SpatialLineDataFrame is returned. If returnclass is not set a data.frame of coordinates is returned.

Value

If returnclass is not set, a data frame is returned. It contains the longitudes and latitudes of the travel path between the two points.

If returnclass is set to "sp", a SpatialLinesDataFrame is returned.

If returnclass is set to "sf", an sf LINESTRING is returned.

SpatialLinesDataFrame and sf LINESTRING contain 4 fields: identifiers of origine and destination, travel time in minutes and travel distance in kilometers.

If overview is FALSE, a named numeric vector is returned. It contains travel time (in minutes) and travel distance (in kilometers).

Examples

```
## Not run:
# Load data
data("berlin")
library(sf)
# Travel path between points
route1 <- osrmRoute(src = apotheker.sf[1, ], dst = apotheker.df[16, ],
                    returnclass="sf")
# Travel path between points excluding motorways
route2 <- osrmRoute(src = apotheker.sf[1, ], dst = apotheker.df[16, ],
                    returnclass="sf", exclude = "motorway")
# Display paths
plot(st_geometry(route1))
plot(st_geometry(route2), col = "red", add = TRUE)
plot(st_geometry(apoltheker.sf[c(1,16),]), col = "red", pch = 20, add = TRUE)

# Return only duration and distance
route3 <- osrmRoute(src = apotheker.sf[1, ], dst = apotheker.df[16, ],
                    overview = FALSE)
route3

# Using only coordinates
route4 <- osrmRoute(src = c(13.412, 52.502),
                    dst = c(13.454, 52.592),
                    returnclass = "sf")
plot(st_geometry(route4))

# Using via points
```

```
pts <- structure(
  list(x = c(13.32500, 13.30688, 13.30519, 13.31025,
            13.4721, 13.56651, 13.55303, 13.37263, 13.50919, 13.5682),
       y = c(52.40566, 52.44491, 52.52084, 52.59318, 52.61063, 52.55317,
            52.50186, 52.49468, 52.46441, 52.39669)),
  class = "data.frame", row.names = c(NA, -10L))
route5 <- osrmRoute(loc = pts, returnclass = "sf")
plot(st_geometry(route5), col = "red", lwd = 2)
points(pts, pch = 20, cex = 2)

## End(Not run)
```

osrmTable

Get Travel Time Matrices Between Points

Description

Build and send OSRM API queries to get travel time matrices between points. This function interfaces the *table* OSRM service.

Usage

```
osrmTable(
  loc,
  src = NULL,
  dst = NULL,
  exclude = NULL,
  gepaf = FALSE,
  measure = "duration"
)
```

Arguments

loc	a data frame containing 3 fields: points identifiers, longitudes and latitudes (WGS84). It can also be a <code>SpatialPointsDataFrame</code> , a <code>SpatialPolygonsDataFrame</code> or an <code>sf</code> object. If so, row names are used as identifiers. If <code>loc</code> parameter is used, all pair-wise distances are computed.
src	a data frame containing origin points identifiers, longitudes and latitudes (WGS84). It can also be a <code>SpatialPointsDataFrame</code> , a <code>SpatialPolygonsDataFrame</code> or an <code>sf</code> object. If so, row names are used as identifiers. If <code>dst</code> and <code>src</code> parameters are used, only pairs between <code>src</code> / <code>dst</code> are computed.
dst	a data frame containing destination points identifiers, longitudes and latitudes (WGS84). It can also be a <code>SpatialPointsDataFrame</code> a <code>SpatialPolygonsDataFrame</code> or an <code>sf</code> object. If so, row names are used as identifiers.
exclude	pass an optional "exclude" request option to the OSRM API.
gepaf	a boolean indicating if coordinates are sent encoded with the google encoded algorithm format (TRUE) or not (FALSE). Must be FALSE if using the public OSRM API.

measure a character indicating what measures are calculated. It can be "duration" (in minutes), "distance" (meters), or both c('duration', 'distance'). The demo server only allows "duration".

Details

If loc, src or dst are data frames we assume that the 3 first columns of the data frame are: identifiers, longitudes and latitudes.

Value

A list containing 3 data frames is returned. durations is the matrix of travel times (in minutes), sources and destinations are the coordinates of the origin and destination points actually used to compute the travel times (WGS84).

Note

If you want to get a large number of distances make sure to set the "max-table-size" argument (Max. locations supported in table) of the OSRM server accordingly.

See Also

[osrmIsochrone](#)

Examples

```
## Not run:
# Load data
data("berlin")

# Inputs are data frames
# Travel time matrix
distA <- osrmTable(loc = apotheke.df[1:50, c("id", "lon", "lat")])
# First 5 rows and columns
distA$durations[1:5,1:5]

# Travel time matrix with different sets of origins and destinations
distA2 <- osrmTable(src = apotheke.df[1:10,c("id", "lon", "lat")],
                   dst = apotheke.df[11:20,c("id", "lon", "lat")])
# First 5 rows and columns
distA2$durations[1:5,1:5]

# Inputs are sf points
distA3 <- osrmTable(loc = apotheke.sf[1:10,])
# First 5 rows and columns
distA3$durations[1:5,1:5]

# Travel time matrix with different sets of origins and destinations
distA4 <- osrmTable(src = apotheke.sf[1:10,], dst = apotheke.sf[11:20,])
# First 5 rows and columns
distA4$durations[1:5,1:5]
```

```
## End(Not run)
```

```
osrmTrip
```

Get the Travel Geometry Between Multiple Unordered Points

Description

Build and send an OSRM API query to get the shortest travel geometry between multiple points. This function interfaces the *trip* OSRM service.

Usage

```
osrmTrip(loc, exclude = NULL, overview = "simplified", returnclass = "sp")
```

Arguments

<code>loc</code>	a <code>SpatialPointsDataFrame</code> or an <code>sf</code> object of the waypoints, or a <code>data.frame</code> with points as rows and 3 columns: identifier, longitudes and latitudes (WGS84 decimal degrees).
<code>exclude</code>	pass an optional "exclude" request option to the OSRM API.
<code>overview</code>	"full", "simplified". Add geometry either full (detailed) or simplified according to highest zoom level it could be display on.
<code>returnclass</code>	if <code>returnclass="sf"</code> an <code>sf</code> <code>LINestring</code> is returned. If <code>returnclass="sp"</code> a <code>SpatialLineDataFrame</code> is returned.

Details

As stated in the OSRM API, if input coordinates can not be joined by a single trip (e.g. the coordinates are on several disconnecte islands) multiple trips for each connected component are returned.

Value

A list of connected components. Each component contains:

trip A `SpatialLinesDataFrame` or `sf` `LINestring` (`loc`'s CRS if there is one, WGS84 if not) containing a line for each step of the trip.

summary A list with 2 components: duration (in minutes) and distance (in kilometers).
