Description

Extract AIC value of UComp object

Usage

```r
## S3 method for class 'UComp'
AIC(object, ..., k = 2)
```

Arguments

- `object`: Object of class “UComp”.
- `...`: Additional inputs to function.
- `k`: The penalty per parameter to be used.

Details

Selection criteria for models with different number of parameters, the smaller AIC the better. The formula used here is $AIC = -2(ln(L) - k)/n$, where $ln(L)$ is the log-likelihood at the optimum, $k$ is the number of parameters plus non-stationary states and $n$ is the number of observations. Mind that this formulation differs from the usual definition that does not divide by $n$. This makes that $AIC(m)$ and $AIC(logLik(m))$ give different results, being m an UComp object.
Description

Foreign arrivals by air in Spain in thousands of passengers (airpas).

Usage

airpas

Format

Time series objects.

Monthly data from January 1992 to December 2019

Source

airpas

Examples

```r
## Not run:
airpas

## End(Not run)
```
Description

Extract BIC (or SBC) value of UComp object

Usage

```r
## S3 method for class 'UComp'
BIC(object, ...)
```

Arguments

- **object**: Object of class “UComp”.
- **...**: Additional inputs to function.

Details

Selection criteria for models with different number of parameters, the smaller BIC the better. The formula used here is $BIC = (-2\ln(L) + k\ln(n))/n$, where $\ln(L)$ is the log-likelihood at the optimum, $k$ is the number of parameters plus non-stationary states and $n$ is the number of observations. Mind that this formulation differs from the usual definition that does not divide by $n$. This makes that $BIC(m)$ and $BIC(\logLik(m))$ give different results, being m an UComp object.

Examples

```r
y <- log(AirPassengers)
m1 <- UCmodel(y, model = "llt/equal/arma(0,0)"
BIC(m1)
```
Methane concentration at Cape Grim in Australia (ch4).

Description

Methane concentration at Cape Grim in Australia (ch4).

Usage

ch4

Format

Time series objects.

Monthly data from January 1992 to December 2019

Source

CH4 data

Examples

## Not run:

ch4

## End(Not run)

getp0

Description

Get initial conditions for parameters of UComp object

Usage

gotp0(y, model = "llt/equal/arma(0,0)", periods = NA)

Arguments

- **y**: a time series to forecast.
- **model**: any valid UComp model without any ?.
- **periods**: vector of fundamental period and harmonics required.
Details

Provides initial parameters of a given model for the time series. They may be changed arbitrarily by the user to include as an input \( p_0 \) to \( \text{UC} \) or \( \text{UCmodel} \) functions (see example below). There is no guarantee that the model will converge and selecting initial conditions should be used with care.

Value

A set of parameters \( p_0 \) of an object of class \( \text{UComp} \) to use as input to \( \text{UC} \), \( \text{UCmodel} \) or \( \text{UCsetup} \).

Author(s)

Diego J. Pedregal

## Not run:
OECDgdp

## End(Not run)
### Description
Forecasting using structural Unobseved Components models with prediction intervals

### Usage
```r
## S3 method for class 'UComp'
predict(object, newdata = NULL, n.ahead = NULL, level = 0.95, ...)
```

### Arguments
- `object`: Object of class “UComp”.
- `newdata`: New output data to apply “UComp” object to.
- `n.ahead`: Number of steps ahead to forecast or new inputs variables including their predictions.
- `level`: Confidence level for prediction intervals.
- `...`: Ignored.

### Details
See help of `UC`.

### Value
A matrix with the mean forecasts and lower and upper prediction intervals

### Author(s)
Diego J. Pedregal

### See Also
- `UC`, `UCmodel`, `UCvalidate`, `UCfilter`, `UCsmooth`, `UCdisturb`, `UCcomponents`

### Examples
```r
y <- log(AirPassengers)
m1 <- UCmodel(y, model = "llt/eq/arma(0,0)")
f1 <- predict(m1)
```
### Description
Sales index for large retailers in Spain

### Usage
`sales`

### Format
Time series objects.
- Monthly data from January 1995 to December 2019

### Source
`sales`

### Examples
```r
## Not run:
sales
## End(Not run)
```

---

### Description
size of vectors or matrices

### Usage
`size(y)`

### Arguments
- `y` matrix, array or vector

### Author(s)
- Diego J. Pedregal
Description

Runs all relevant functions for UC modelling

Usage

```
UC(
y,
  u = NULL,
  model = "?/none/?/?",
  h = NA,
  outlier = NA,
  tTest = FALSE,
  criterion = "aic",
  periods = NA,
  verbose = FALSE,
  stepwise = FALSE,
  p0 = -9999.9,
  arma = TRUE
)
```

Arguments

- **y**: a time series to forecast (it may be either a numerical vector or a time series object). This is the only input required. If a vector, the additional input `periods` should be supplied compulsorily (see below).

- **u**: a matrix of external regressors included only in the observation equation. (it may be either a numerical vector or a time series object). If the output wanted to be forecast, matrix `u` should contain future values for inputs.

- **model**: the model to estimate. It is a single string indicating the type of model for each component. It allows two formats "trend/seasonal/irregular" or "trend/cycle/seasonal/irregular". The possibilities available for each component are:
  - Seasonal: ? / none / equal / different;
  - Irregular: ? / none / arma(0, 0) / arma(p, q) - with p and q integer positive orders;
  - Cycles: ? / none / combination of positive or negative numbers. Positive numbers fix the period of the cycle while negative values estimate the period taking as initial condition the absolute value of the period supplied. Several cycles with positive or negative values are possible and if a question mark is included, the model test for the existence of the cycles specified. The following are valid examples with different meanings: 48, 48?, -48, -48?, 48+60, -48+60, -48-60, 48-60, 48+60?, -48+60?, -48-60?, 48-60?.

- **h**: NA
- **outlier**: NA
- **tTest**: FALSE
- **criterion**: "aic"
- **periods**: NA
- **verbose**: FALSE
- **stepwise**: FALSE
- **p0**: -9999.9
- **arma**: TRUE
forecast horizon. If the model includes inputs h is not used, the length of u is used instead.

* outlier: critical level of outlier tests. If NA it does not carry out any outlier detection (default). A positive value indicates the critical minimum t test for outlier detection in any model during identification. Three types of outliers are identified, namely Additive Outliers (AO), Level Shifts (LS) and Slope Change (SC).

* tTest: augmented Dickey Fuller test for unit roots used in stepwise algorithm (TRUE / FALSE). The number of models to search for is reduced, depending on the result of this test.

* criterion: information criterion for identification ("aic", "bic" or "aicc").

* periods: vector of fundamental period and harmonics required.

* verbose: intermediate results shown about progress of estimation (TRUE / FALSE).

* stepwise: stepwise identification procedure (TRUE / FALSE).

* p0: initial parameter vector for optimisation search.

* arma: check for arma models for irregular components (TRUE / FALSE).

**Details**

UC is a function for modelling and forecasting univariate time series according to Unobserved Components models (UC). It sets up the model with a number of control variables that govern the way the rest of functions in the package work. It also estimates the model parameters by Maximum Likelihood, forecasts the data, performs smoothing, estimates model disturbances, estimates components and shows statistical diagnostics. Standard methods applicable to UComp objects are print, summary, plot, fitted, residuals, logLik, AIC, BIC, coef, predict, tsdiag.

**Value**

An object of class UComp. It is a list with fields including all the inputs and the fields listed below as outputs. All the functions in this package fill in part of the fields of any UComp object as specified in what follows (function UC fills in all of them at once):

After running UCmodel or UCestim:

- p: Estimated parameters
- v: Estimated innovations (white noise in correctly specified models)
- yFor: Forecasted values of output
- yForV: Variance of forecasted values of output
- criteria: Value of criteria for estimated model
- iter: Number of iterations in estimation
- grad: Gradient at estimated parameters
- covp: Covariance matrix of parameters

After running UCvalidate:

- table: Estimation and validation table

After running UCcomponents:
• **comp**: Estimated components in matrix form
• **compV**: Estimated components variance in matrix form

After running `UCfilter`, `UCsmooth` or `UCdisturb`:
• **yFit**: Fitted values of output
• **yFitV**: Variance of fitted values of output
• **a**: State estimates
• **P**: Variance of state estimates
• **aFor**: Forecasts of states
• **PFor**: Forecasts of states variances

After running `UCdisturb`:
• **eta**: State perturbations estimates
• **eps**: Observed perturbations estimates

**Author(s)**
Diego J. Pedregal

**See Also**
`UC`, `UCvalidate`, `UCfilter`, `UCsmooth`, `UCdisturb`, `UCcomponents`, `UCHp`

**Examples**
```r
y <- log(AirPassengers)
m1 <- UC(y)
m1 <- UC(y, model = "llt/different/arma(0,0)")
```

---

**Description**
Estimates unobserved components of UC models. Standard methods applicable to UComp objects are print, summary, plot, fitted, residuals, logLik, AIC, BIC, coef, predict, tsdiag.

**Usage**
`UCcomponents(sys)`

**Arguments**
```r
sys an object of type UComp created with UC or UCmodel
```
Value
The same input object with the appropriate fields filled in, in particular:

- comp: Estimated components in matrix form
- compV: Estimated components variance in matrix form

Author(s)
Diego J. Pedregal

See Also
UC, UCmodel, UCvalidate, UCfilter, UCSmooth, UCdisturb, UChp

Examples
m1 <- UC(log(sales))
m1 <- UCcomponents(m1)

Description
Runs the Disturbance Smoother for UC models Standard methods applicable to UComp objects are print, summary, plot, fitted, residuals, logLik, AIC, BIC, coef, predict, tsdiag.

Usage
UCdisturb(sys)

Arguments
sys an object of type UComp created with UC

Value
The same input object with the appropriate fields filled in, in particular:

- yFit: Fitted values of output
- yFitV: Variance of fitted values of output
- a: State estimates
- P: Variance of state estimates (diagonal of covariance matrices)
- eta: State perturbations estimates
- eps: Observed perturbations estimates
**Description**

Estimates and forecasts UC models

**Usage**

`UCestim(sys)`

**Arguments**

sys an object of type UComp created with UC

**Details**

`UCestim` estimates and forecasts a time series using an UC model. The optimization method is a BFGS quasi-Newton algorithm with a backtracking line search using Armijo conditions. Parameter names in output table are the following:

- Damping: Damping factor for DT trend.
- Level: Variance of level disturbance.
- Slope: Variance of slope disturbance.
- Rho(#): Damping factor of cycle #.
- Period(#): Estimated period of cycle #.
- Var(#): Variance of cycle #.
- Seas(#): Seasonal harmonic with period #.
- Irregular: Variance of irregular component.
- AR(#): AR parameter of lag #.
- MA(#): MA parameter of lag #.
- AO#: Additive outlier in observation #.
- LS#: Level shift outlier in observation #.
UCfilter

- SC#: Slope change outlier in observation #.
- Beta(#): Beta parameter of input #.
- Cnst: Constant.

Standard methods applicable to UComp objects are print, summary, plot, fitted, residuals, logLik, AIC, BIC, coef, predict, tsdiag.

Value

The same input object with the appropriate fields filled in, in particular:

- p: Estimated transformed parameters
- v: Estimated innovations (white noise in correctly specified models)
- yFor: Forecast values of output
- yForV: Variance of forecast values of output
- criteria: Value of criteria for estimated model
- covp: Covariance matrix of estimated transformed parameters
- grad: Gradient of log-likelihood at the optimum
- iter: Estimation iterations

Examples

```r
m1 <- UCsetup(log(AirPassengers))
m1 <- UCestim(m1)
```

---

UCfilter

**Description**

Runs the Kalman Filter for UC models Standard methods applicable to UComp objects are print, summary, plot, fitted, residuals, logLik, AIC, BIC, coef, predict, tsdiag.

**Usage**

```r
UCfilter(sys)
```
**Arguments**

`sys`  
an object of type UComp created with UC

**Value**

The same input object with the appropriate fields filled in, in particular:

- `yFit`: Fitted values of output
- `yFitV`: Variance of fitted values of output
- `a`: State estimates
- `P`: Variance of state estimates (diagonal of covariance matrices)

Examples

cycle <- UChp(USgdp)
plot(cycle)

Description
Estimates and forecasts UC general univariate models

Usage

UCmodel(
y, 
u = NULL, 
model = "?/none/?/?", 
h = NA, 
outlier = NA, 
tTest = FALSE, 
criterion = "aic", 
periods = NA, 
verbose = FALSE, 
stepwise = FALSE, 
p0 = -9999.9, 
arma = TRUE
)

Arguments

y a time series to forecast (it may be either a numerical vector or a time series object). This is the only input required. If a vector, the additional input periods should be supplied compulsorily (see below).

u a matrix of external regressors included only in the observation equation. (it may be either a numerical vector or a time series object). If the output wanted to be forecast, matrix u should contain future values for inputs.

model the model to estimate. It is a single string indicating the type of model for each component. It allows two formats “trend-seasonal/irregular” or “trend/cycle/seasonal/irregular”. The possibilities available for each component are:
• Trend: ? / none / rw / irw / llt / dt;
• Seasonal: ? / none / equal / different;
- Irregular: ? / none / arma(0, 0) / arma(p, q) - with p and q integer positive orders;
- Cycles: ? / none / combination of positive or negative numbers. Positive numbers fix the period of the cycle while negative values estimate the period taking as initial condition the absolute value of the period supplied. Several cycles with positive or negative values are possible and if a question mark is included, the model test for the existence of the cycles specified. The following are valid examples with different meanings: 48, 48?, -48, -48?, 48+60, -48+60, -48-60, 48-60, 48+60?, -48+60?, -48-60?, 48-60?.

**h**
forecast horizon. If the model includes inputs h is not used, the length of u is used instead.

**outlier**
critical level of outlier tests. If NA it does not carry out any outlier detection (default). A positive value indicates the critical minimum t-test for outlier detection in any model during identification. Three types of outliers are identified, namely Additive Outliers (AO), Level Shifts (LS) and Slope Change (SC).

**tTest**
augmented Dickey Fuller test for unit roots used in stepwise algorithm (TRUE / FALSE). The number of models to search for is reduced, depending on the result of this test.

**criterion**
information criterion for identification ("aic", "bic" or "aicc").

**periods**
vector of fundamental period and harmonics required.

**verbose**
intermediate results shown about progress of estimation (TRUE / FALSE).

**stepwise**
stepwise identification procedure (TRUE / FALSE).

**p0**
initial parameter vector for optimisation search.

**arma**
check for arma models for irregular components (TRUE / FALSE).

**Details**

UCmodel is a function for modelling and forecasting univariate time series according to Unobserved Components models (UC). It sets up the model with a number of control variables that govern the way the rest of functions in the package work. It also estimates the model parameters by Maximum Likelihood and forecasts the data. ```
Description

A package for fast automatic identification of Unobserved Components models

Details

UComp is a package for time series modelling and forecasting of Unobserved Components models inspired on the structural family due to A.C. Harvey (Basic Structural Model: BSM), enhanced with automatic identification tools by Diego J. Pedregal. The package is designed for automatic identification among a wide range of possible models for trends, cycles, seasonal and irregular components. The model may include exogenous variables. ARMA irregular components and automatic detection of outliers are also possible.

Description

Sets up UC general univariate models

Usage

UCsetup(
  y,
  u = NULL,
  model = "?/none/?/?",
  h = NA,
  outlier = NA,
  tTest = FALSE,
  criterion = "aic",
  periods = NA,
  verbose = FALSE,
  stepwise = FALSE,
  p0 = -9999.9,
  arma = TRUE
)

Arguments

y

a time series to forecast (it may be either a numerical vector or a time series object). This is the only input required. If a vector, the additional input periods should be supplied compulsorily (see below).

u

a matrix of external regressors included only in the observation equation. (it may be either a numerical vector or a time series object). If the output wanted to be forecast, matrix u should contain future values for inputs.

model

the model to estimate. It is a single string indicating the type of model for each component. It allows two formats "trend/seasonal/irregular" or "trend/cycle/seasonal/irregular". The possibilities available for each component are:

- Seasonal: ? / none / equal / different;
- Irregular: ? / none / arma(0, 0) / arma(p, q) - with p and q integer positive orders;
- Cycles: ? / none / combination of positive or negative numbers. Positive numbers fix the period of the cycle while negative values estimate the period taking as initial condition the absolute value of the period supplied. Several cycles with positive or negative values are possible and if a question mark is included, the model test for the existence of the cycles specified. The following are valid examples with different meanings: 48, 48?, -48, -48?, 48+60, -48+60, -48-60, 48-60, 48+60?, -48+60?, -48-60?, 48-60?.

h

a vector of length equal to y indicating the forecast origin.

outlier

a vector of length equal to y indicating the presence of outliers.

tTest

a character string indicating whether a test for the existence of cycles should be performed (it may be either FALSE, TRUE or "false", "true", "true").

criterion

a string indicating the criterion used to select the best model. Possible values are "aic", "bic", "signific", "stepwise" or "false".

periods

the cycle period.

verbose

a logical indicating whether the function should provide verbose output.

stepwise

a logical indicating whether the function should perform a stepwise procedure.

p0

the value of the parameter p that is used in the selection of the model.

arma

a logical indicating whether the function should estimate the ARMA component of the model.
**UCsetup**

- **h**: forecast horizon. If the model includes inputs h is not used, the length of u is used instead.
- **outlier**: critical level of outlier tests. If NA it does not carry out any outlier detection (default). A positive value indicates the critical minimum t test for outlier detection in any model during identification. Three types of outliers are identified, namely Additive Outliers (AO), Level Shifts (LS) and Slope Change (SC).
- **tTest**: augmented Dickey Fuller test for unit roots used in stepwise algorithm (TRUE / FALSE). The number of models to search for is reduced, depending on the result of this test.
- **criterion**: information criterion for identification ("aic", "bic" or "aicc").
- **periods**: vector of fundamental period and harmonics required.
- **verbose**: intermediate results shown about progress of estimation (TRUE / FALSE).
- **stepwise**: stepwise identification procedure (TRUE / FALSE).
- **p0**: initial parameter vector for optimisation search.
- **arma**: check for arma models for irregular components (TRUE / FALSE).

**Details**

See help of UC.

**Value**

An object of class UComp. It is a list with fields including all the inputs and the fields listed below as outputs. All the functions in this package fill in part of the fields of any UComp object as specified in what follows (function UC fills in all of them at once):

After running UCmodel or UCestim:

- **p**: Estimated parameters
- **v**: Estimated innovations (white noise in correctly specified models)
- **yFor**: Forecasted values of output
- **yForV**: Variance of forecasted values of output
- **criteria**: Value of criteria for estimated model
- **iter**: Number of iterations in estimation
- **grad**: Gradient at estimated parameters
- **covp**: Covariance matrix of parameters

After running UCvalidate:

- **table**: Estimation and validation table

After running UCcomponents:

- **comp**: Estimated components in matrix form
- **compV**: Estimated components variance in matrix form

After running UCfilter, UCsmooth or UCdisturb:
- yFit: Fitted values of output
- yFitV: Variance of fitted values of output
- a: State estimates
- P: Variance of state estimates
- aFor: Forecasts of states
- PFor: Forecasts of states variances

After running UCdisturb:
- eta: State perturbations estimates
- eps: Observed perturbations estimates

Standard methods applicable to UComp objects are print, summary, plot, fitted, residuals, logLik, AIC, BIC, coef, predict, tsdiag.

Examples
```r
y <- log(sales)
m1 <- UCsetup(y)
m1 <- UCsetup(y, outlier = 4)
m1 <- UCsetup(y, model = "llt/equal/arma(0,0)"")
m1 <- UCsetup(y, model = "?/?/?/?")
m1 <- UCsetup(y, model = "llt/?/equal/?", outlier = 4)
```

Description
Runs the Fixed Interval Smoother for UC models Standard methods applicable to UComp objects are print, summary, plot, fitted, residuals, logLik, AIC, BIC, coef, predict, tsdiag.

Usage
```r
UCsmooth(sys)
```

Arguments
```r
sys an object of type UComp created with UC
```
Value

The same input object with the appropriate fields filled in, in particular:

- yFit: Fitted values of output
- yFitV: Variance of fitted values of output
- a: State estimates
- P: Variance of state estimates (diagonal of covariance matrices)

Author(s)

Diego J. Pedregal

See Also

UC, UCmodel, UCvalidate, UCfilter, UCdisturb, UCcomponents, UChp

Examples

```r
m1 <- UC(log(AirPassengers))
m1 <- UCsmooth(m1)
```

Description

Shows a table of estimation and diagnostics results for UC models. Equivalent to print or summary. The table shows information in four sections: Firstly, information about the model estimated, the relevant periods of the seasonal component included, and further information about convergence. Secondly, parameters with their names are provided, the asymptotic standard errors, the ratio of the two, and the gradient at the optimum. One asterisk indicates concentrated-out parameters and two asterisks signals parameters constrained during estimation. Thirdly, information criteria and the value of the log-likelihood. Finally, diagnostic statistics about innovations, namely, the Ljung-Box Q test of absense of autocorrelation statistic for several lags, the Jarque-Bera gaussianity test, and a standard ratio of variances test.

Usage

```r
UCvalidate(sys, printScreen = TRUE)
```

Arguments

- **sys**: an object of type UComp created with UC
- **printScreen**: print to screen or just return output table
