Package ‘arsenal’

February 6, 2021

Title  An Arsenal of ‘R’ Functions for Large-Scale Statistical Summaries

Version 3.6.1

Date 2021-02-05

Description  An Arsenal of 'R' functions for large-scale statistical summaries, which are streamlined to work within the latest reporting tools in 'R' and 'RStudio' and which use formulas and versatile summary statistics for summary tables and models. The primary functions include tableby(), a Table-1-like summary of multiple variable types 'by' the levels of one or more categorical variables; paired(), a Table-1-like summary of multiple variable types paired across two time points; modelsum(), which performs simple model fits on one or more endpoints for many variables (univariate or adjusted for covariates); freqlist(), a powerful frequency table across many categorical variables; comparedf(), a function for comparing data.frames; and write2(), a function to output tables to a document.

Suggests broom (>= 0.7.1), magrittr, rmarkdown, testthat, xtable, pander, survival (>= 2.43-1), coin, pROC, MASS, splines, rpart, yaml, geepack

Depends R (>= 3.4.0), stats (>= 3.4.0)

Imports knitr (>= 1.29), utils (>= 3.4.0)

An Arsenal of 'R' Functions for Large-Scale Statistical Summaries

Description

An Arsenal of 'R' functions for large-scale statistical summaries, which are streamlined to work within the latest reporting tools in 'R' and 'RStudio' and which use formulas and versatile summary statistics for summary tables and models.

Details

The package download, NEWS, and README are available on CRAN: https://cran.r-project.org/package=arsenal

Functions

Below are listed some of the most widely used functions available in arsenal:

- **tableby**: Summary statistics of a set of independent variables by a categorical variable.
- **paired**: Summary statistics of a set of independent variables paired across two timepoints.
- **modelsum**: Fit models over each of a set of independent variables with a response variable.
- **freqlist**: Approximate the output from SAS’s PROC FREQ procedure when using the /list option of the TABLE statement.
- **comparedf**: Compare two data.frames and report any differences between them, much like SAS’s PROC COMPARE procedure.
- **write2word, write2html, write2pdf**: Functions to output tables to a single Word, HTML, or PDF document.
- **write2**: Functions to output tables to a single document. (Also the S3 backbone behind the write2* functions.)
keep.labels: Keep the 'label' attribute on an R object when subsetting.
formulize: A shortcut to generate one-, two-, or many-sided formulas.
mdy.Date and Date.mdy: Convert numeric dates for month, day, and year to Date object, and vice versa.
is.Date: Test if an object is a date.
%nin%: Test for "not in".
al1NA and includeNA: some useful functions for dealing with NAs.

Data

mockstudy: Mock study data for examples.

Examples

library(arsenal)

arseal-defunct  Defunct functions in arsenal

Description

Details about defunct functions in arsenal

Arguments

x, y          See comparedf.
...           Other arguments.

Details

collection.control was renamed to comparedf.control in version 3.0.0.
compare.data.frame was renamed to comparedf in version 3.0.0.
length.tableby was removed in version 2.0.0.
includeNA.character and includeNA.numeric were removed in version 2.0.0 and replaced with a default method.
rangefTime was removed in version 1.5.0.

arsenal_table  arsenal tables with common structure

Description
arsenal tables with common structure

Usage
has_strata(x)

## S3 method for class 'arsenal_table'
x[i, j, ...]

## S3 method for class 'arsenal_table'
labels(object, ...)

## S3 replacement method for class 'arsenal_table'
labels(x) <- value

## S3 method for class 'arsenal_table'
print(x, ...)

## S3 method for class 'arsenal_table'
merge(x, y, all = FALSE, all.x = all, all.y = all, ...)

## S3 method for class 'freqlist'
merge(x, y, all = TRUE, ...)

## S3 method for class 'summary.arsenal_table'
print(
  x,
  ...
)

format = if (!is.null(x$text) & x$text %in% c("html", "latex")) x$text else
Arguments

- **x, y, object**: An object of class "arsenal_table"
- **i, j**: A vector to index x with: either names of variables, a numeric vector, or a logical vector of appropriate length. i indexes the x-variables, and j indexes the by-variables.
- **...**: Other arguments (only used in `print.summary.arsenal_table`)
- **value**: A list of new labels.
- **all, all.x, all.y**: Logicals, denoting which terms to keep if not all are in common.
- **format**: Passed to `kable`: the format for the table. The default here is "markdown". To use the default in `kable`, pass `NULL`. If `x$text` specifies LaTeX or HTML formatting, that format is used in the table.
- **escape**: Passed to `kable`: should special characters be escaped when printed?
- **width, min.split**: Passed to `smart.split` for formatting of the "term" column.

See Also

- `merge`, `labels`

Description

Convert `freqlist` object to a data.frame.

Usage

```r
## S3 method for class 'freqlist'
as.data.frame(x, ..., labelTranslations = NULL, list.ok = FALSE)
```
as.data.frame.modelsum

Arguments

- **x**: An object of class "freqlist".
- **...**: Arguments to pass to `freq.control`
- **labelTranslations**: A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., `list(age = "Age(Years)", meansd = "Mean(SD)")`.
- **list.ok**: If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.

Value

A data.frame corresponding to the `freqlist` object.

Description

Coerce a `modelsum` object to a data.frame.

Usage

```r
## S3 method for class 'modelsum'
as.data.frame(x, ..., labelTranslations = NULL, list.ok = FALSE)
```

Arguments

- **x**: A `modelsum` object.
- **...**: Arguments to pass to `modelsum.control`
- **labelTranslations**: A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., `list(age = "Age(Years)", meansd = "Mean(SD)")`.
- **list.ok**: If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.

Value

A data.frame.
Description

Coerce a `tableby` object to a `data.frame`.

Usage

```r
## S3 method for class 'tableby'
as.data.frame(x, ..., labelTranslations = NULL, list.ok = FALSE)
```

Arguments

- `x`  
  A `tableby` object.
- `...`  
  Arguments to pass to `tableby.control`.
- `labelTranslations`  
  A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., `list(age = "Age(Years)", meansd = "Mean(SD)")`.
- `list.ok`  
  If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.

Value

A `data.frame`.

Author(s)

Ethan Heinzen, based on code originally by Greg Dougherty

`tableby`, `tableby`
comparedf

Compare two data.frames and report differences

Description

Compare two data.frames and report any differences between them, much like SAS’s PROC COMPARE procedure.

Usage

comparedf(x, y, by = NULL, by.x = by, by.y = by, control = NULL, ...)

## S3 method for class 'comparedf'
print(x, ...)

Arguments

x, y
A data.frame to compare

by, by.x, by.y
Which variables are IDs to merge the two data.frames? If set to "row.names", merging will occur over the row.names. If set to NULL (default), merging will occur row-by-row.

control
A list of control parameters from comparedf.control.

...
Other arguments, passed to comparedf.control when appropriate.

Author(s)

Ethan Heinzen, adapted from code from Andrew Hanson

summary.comparedf, comparedf.control, diffs, n.diffs, n.diff.obs

Examples

df1 <- data.frame(id = paste0("person", 1:3), a = c("a", "b", "c"),
                  b = c(1, 3, 4), c = c("f", "e", "d"),
                  row.names = paste0("rn", 1:3), stringsAsFactors = FALSE)
df2 <- data.frame(id = paste0("person", 3:1), a = c("c", "b", "a"),
                  b = c(1, 3, 4), d = paste0("rn", 1:3),
                  row.names = paste0("rn", c(1,3,2)), stringsAsFactors = FALSE)
summary(comparedf(df1, df2))
summary(comparedf(df1, df2, by = "id"))
summary(comparedf(df1, df2, by = "row.names"))
### comparedf.control

**Control settings for comparedf function**

#### Description

Control tolerance definitions for the `comparedf` function.

#### Usage

```r
comparedf.control(
  tol.logical = "none",
  tol.num = c("absolute", "percent", "pct"),
  tol.num.val = sqrt(.Machine$double.eps),
  int.as.num = FALSE,
  tol.char = c("none", "trim", "case", "both"),
  tol.factor = c("none", "levels", "labels"),
  factor.as.char = FALSE,
  tol.date = "absolute",
  tol.date.val = 0,
  tol.other = "none",
  tol.vars = "none",
  max.print.vars = NA,
  max.print.obs = NA,
  max.print.diffs.per.var = 10,
  max.print.diffs = 50,
  max.print.attrs = NA,
  ...
)
```

#### Arguments

- **tol.logical, tol.num, tol.char, tol.factor, tol.date, tol.other**
  A function or one of the shortcut character strings or a list thereof, denoting the tolerance function to use for a given data type. See "details", below.

- **tol.num.val**
  Numeric; maximum value of differences allowed in numerics (fed to the function given in `tol.num`).

- **int.as.num**
  Logical; should integers be coerced to numeric before comparison? Default FALSE.

- **factor.as.char**
  Logical; should factors be coerced to character before comparison? Default FALSE.

- **tol.date.val**
  Numeric; maximum value of differences allowed in dates (fed to the function given in `tol.date`).

- **tol.vars**
  Either "none" (the default), denoting that variable names are to be matched as-is, a named vector manually specifying variable names to compare (where the
names correspond to columns of x and the values correspond to columns of y),
or a character vector denoting equivalence classes for characters in the variable
names. See "details", below.

max.print.vars Integer denoting maximum number of variables to report in the "variables not
shared" and "variables not compared" output. NA will print all differences.

max.print.obs Integer denoting maximum number of not-shared observations to report. NA will
print all differences.

max.print.diffs.per.var, max.print.diffs Integers denoting the maximum number of differences to report for each variable
or overall. NA will print all differences for each variable or overall.

max.print.attrs Integers denoting the maximum number of non-identical attributes to report. NA
will print all differences.

max.print.diff Deprecated.

Details

The following character strings are accepted:

• tol.logical = "none": compare logicals exactly as they are.
• tol.num = "absolute": compare absolute differences in numerics.
• tol.num = "percent", tol.num = "pct" compare percent differences in numerics.
• tol.char = "none": compare character strings exactly as they are.
• tol.char = "trim": left-justify and trim all trailing white space.
• tol.char = "case": allow differences in upper/lower case.
• tol.char = "both": combine "trim" and "case".
• tol.factor = "none": match both character labels and numeric levels.
• tol.factor = "levels": match only the numeric levels.
• tol.factor = "labels": match only the labels.
• tol.date = "absolute": compare absolute differences in dates.
• tol.other = "none": expect objects of other classes to be exactly identical.

A list with names mapped to x can be used to specify tolerances by variable. One unnamed element
is supported as the default.

tol.vars: If not set to "none" (the default) or a named vector, the tol.vars argument is a character
vector denoting equivalence classes for the characters in the variable names. A single character in
this vector means to replace that character with "". All other strings in this vector are split by
character and replaced by the first character in the string.

E.g., a character vector c(".", "aA", " ") would denote that the dot and underscore are equivalent
(to be translated to a dot), that "a" and "A" are equivalent (to be translated to "a"), and that spaces
should be removed.

The special character string "case" in this vector is the same as specifying paste0(letters,LETTERS).
Value
A list containing the necessary parameters for the `comparedf` function.

Author(s)
Ethan Heinzen

See Also
`comparedf`, `comparedf.tolerances`, `summary.comparedf`

Examples
```r
cntl <- comparedf.control(
  tol.num = "pct",  # calculate percent differences
  tol.vars = c("case", # ignore case
               "._",  # set all underscores to dots.
               "e")  # remove all letter e's
)

cntl <- comparedf.control(tol.char = list(
  "none",  # the default
  x1 = "case", # be case-insensitive for the variable "x1"
  x2 = function(x, y) tol.NA(x, y, x != y | y == "NA") # a custom-defined tolerance
))
```

---

**comparedf.tolerances**  
**comparedf tolerances**

Description
Internal functions defining tolerances for the `comparedf.control` function. To create your own tolerance definitions, see the vignette.

Usage
```r
tol.NA(x, y, idx)
tol.num.absolute(x, y, tol)
tol.num.percent(x, y, tol)
tol.num.pct(x, y, tol)
tol.factor.none(x, y)
tol.factor.levels(x, y)
```
tol.factor.labels(x, y)
tol.char.both(x, y)
tol.char.case(x, y)
tol.char.trim(x, y)
tol.char.none(x, y)
tol.date.absolute(x, y, tol)
tol.logical.none(x, y)
tol.other.none(x, y)

Arguments

x, y  vectors of the appropriate lengths and types.
idx   A logical vector of appropriate length.
tol   A numeric tolerance

Details

tol.NA takes as differences between two vectors any elements which are NA in one but not the other, or which are non-NA in both and TRUE in idx. It is useful for handling NAs in custom tolerance functions.

Value

A logical vector of length equal to that of x and y, where TRUE denotes a difference between x and y, and FALSE denotes no difference between x and y.

Author(s)

Ethan Heinzen

See Also

comparedf.control, comparedf
**diffs**

*Extract differences*

**Description**

Extract differences (diffs()), number of differences (n.diffs()), or number of not-shared observations (n.diff.obs()) from a comparedf object.

**Usage**

```r
n.diff.obs(object, ...)

## S3 method for class 'comparedf'
n.diff.obs(object, ...)

## S3 method for class 'summary.comparedf'
n.diff.obs(object, ...)

n.diffs(object, ...)

## S3 method for class 'comparedf'
n.diffs(object, ...)

## S3 method for class 'summary.comparedf'
n.diffs(object, ...)

diffs(object, ...)

## S3 method for class 'comparedf'
diffs(
  object,
  what = c("differences", "observations"),
  vars = NULL,
  ..., 
  by.var = FALSE
)

## S3 method for class 'summary.comparedf'
diffs(
  object,
  what = c("differences", "observations"),
  vars = NULL,
  ..., 
  by.var = FALSE
)
```
Arguments

object An object of class `comparedf` or `summary.comparedf`.

... Other arguments (not in use at this time).

what Should differences or the not-shared observations be returned?

vars A character vector of variable names to subset the results to.

by.var Logical: should the number of differences by variable be reported, or should all differences be reported (the default).

Author(s)

Ethan Heinzen

See Also

`comparedf` `summary.comparedf`

formulize formulize

formulize

Description

A shortcut to generate one-, two-, or many-sided formulas from vectors of variable names.

Usage

```r
formulize(
  y = "", 
  x = "", 
  ..., 
  data = NULL, 
  collapse = "+", 
  collapse.y = collapse, 
  escape = FALSE
)
```

Arguments

y, x, ... Character vectors, names, or calls to be collapsed (by "+") and put left-to-right in the formula. If data is supplied, these can also be numeric, denoting which column name to use. See examples.

data An R object with non-null column names.

collapse How should terms be collapsed? Default is addition.

collapse.y How should the y-terms be collapsed? Default is addition. Also accepts the special string "list", which combines them into a multiple-left-hand-side formula, for use in other functions.

escape A logical indicating whether character vectors should be coerced to names (that is, whether names with spaces should be surrounded with backticks or not)
Author(s)

Ethan Heinzen

See Also

reformulate

Examples

## two-sided formula
```r
f1 <- formulize("y", c("x1", "x2", "x3"))
```

## one-sided formula
```r
f2 <- formulize(x = c("x1", "x2", "x3"))
```

## multi-sided formula
```r
f3 <- formulize("y", c("x1", "x2", "x3"), c("z1", "z2"), "w1")
```

## can use numerics for column names
data(mockstudy)
f4 <- formulize(y = 1, x = 2:4, data = mockstudy)

## mix and match
```r
f5 <- formulize(1, c("x1", "x2", "x3"), data = mockstudy)
```

## get an interaction
```r
f6 <- formulize("y", c("x1\*x2", "x3"))
```

## get only interactions
```r
f7 <- formulize("y", c("x1", "x2", "x3"), collapse = "\*")
```

## no intercept
```r
f8 <- formulize("y", "x1 - 1")
f9 <- formulize("y", c("x1", "x2", "-1"))
```

## LHS as a list to use in arsenal functions
```r
f10 <- formulize(c("y1", "y2", "y3"), c("x", "z"), collapse.y = "list")
```

## use in an lm
```r
f11 <- formulize(2, 3:4, data = mockstudy)
summary(lm(f11, data = mockstudy))
```

## using non-syntactic names or calls (like reformulate example)
f12 <- formulize(as.name("+-"), c("\"P/E\"", "\% Growth\""))
f12 <- formulize("+-", c("P/E", "% Growth"), escape = TRUE)

f <- Surv(ft, case) ~ a + b
```r
f13 <- formulize(f[[2]], f[[3]])
```
Description

Control test and summary settings for the freqlist function.

Usage

freq.control(
    sparse = FALSE,
    single = FALSE,
    dupLabels = FALSE,
    digits.count = 0L,
    digits.pct = 2L,
    ...,  
    digits = NULL
)

Arguments

    sparse        a logical value indicating whether to keep rows with counts of zero. The default is FALSE (drop zero-count rows).
    single        logical, indicating whether to collapse results created using a strata variable into a single table for printing
    dupLabels     logical: should labels which are the same as the row above be printed? The default (FALSE) more closely approximates PROC FREQ output from SAS, where a label carried down from the row above is left blank.
    digits.count  Number of decimal places for count values.
    digits.pct    Number of decimal places for percents.
    ...           additional arguments.
    digits        A deprecated argument

Value

A list with settings to be used within the freqlist function.

Author(s)

Ethan Heinzen

See Also

freqlist, summary.freqlist, freqlist.internal
Description

Approximate the output from SAS's PROC FREQ procedure when using the /list option of the TABLE statement.

Usage

freqlist(object, ...)

## S3 method for class 'table'
freqlist(
  object,
  na.options = c("include", "showexclude", "remove"),
  strata = NULL,
  labelTranslations = NULL,
  control = NULL,
  ...
)

## S3 method for class 'formula'
freqlist(
  formula,
  data,
  subset,
  na.action,
  na.options = c("include", "showexclude", "remove"),
  strata = NULL,
  labelTranslations = NULL,
  control = NULL,
  addNA,
  exclude,
  drop.unused.levels,
  ...
)

Arguments

object  An R object, usually of class "table" or class "xtabs"

...  additional arguments. In the formula method, these are passed to the table method. These are also passed to freq.control

na.options  a character string indicating how to handling missing values: "include" (include values with NAs in counts and percentages), "showexclude" (show NAs but exclude from cumulative counts and all percentages), "remove" (remove values with NAs); default is "include"
freq.list.internal

strata
(formerly groupBy) an optional character string specifying a variable(s) to use for grouping when calculating cumulative counts and percentages. summary.freqlist will also separate by grouping variable for printing. Note that this is different from modelsum and tableby, which take bare column names (and only one, at that!)

labelTranslations
an optional character string (or list) of labels to use for variable levels when summarizing. Names will be matched appropriately.

control
control parameters to handle optional settings within freqlist. See freq.control formula, data, subset, na.action, addNA, exclude, drop.unused.levels Arguments passed to xtabs.

Value
An object of class c("freqlist","arsenal_table")

Author(s)
Tina Gunderson, with revisions by Ethan Heinzen

See Also
arsenal_table, summary.freqlist, freq.control, freqlist.internal, table, xtabs

Examples

# load mockstudy data
data(mockstudy)
tab.ex <- table(mockstudy[, c("arm", "sex", "mdquality.s")], useNA = "ifany")
noby <- freqlist(tab.ex, na.options = "include")
summary(noby)

# show the top 6 rows' frequencies and percents
head(summary(sort(noby, decreasing = TRUE)[c(1:4, 6)]))

withby <- freqlist(tab.ex, strata = c("arm","sex"), na.options = "showexclude")
summary(withby)
Usage

is.freqlist(x)

is.summary.freqlist(x)

## S3 method for class 'summary.freqlist'
head(x, n = 6L, ...)

## S3 method for class 'summary.freqlist'
tail(x, n = 6L, ...)

## S3 method for class 'freqlist'
sort(x, decreasing = FALSE, ...)

Arguments

x  A freqlist object.
n  A single integer. See head or tail for more details
... Other arguments.
decreasing Should the sort be increasing or decreasing?

Details

Note that sort() has to recalculate cumulative statistics. Note also that the reordering of rows will also affect which labels are duplicates; you may also want to consider using dupLabels=TRUE in freq.control().

---

internal.functions  Internal Functions

Description

Internal Functions

Usage

smart.split(string, width = Inf, min.split = -Inf)

replace2(x, list, values)
Arguments

- **string**: A character vector
- **width**: Either Inf or NULL to specify no splitting, or a positive integer giving the largest allowed string length.
- **min.split**: Either -Inf or NULL to specify no lower bound on the string length, or a positive integer giving the minimum string length.
- **x**: vector
- **list**: an index vector
- **values**: replacement values

Value

For `smart.split`, a list of the same length as `string`, with each element being the "intelligently" split string.

For `replace2`, a vector with the proper values replaced.

See Also

- `replace`

---

### keep.labels

**Keep Labels**

- **Description**
  
  Keep the 'label' attribute on an R object when subsetting. `loosen.labels` allows the 'label' attribute to be lost again.

- **Usage**
  
  ```r
  keep.labels(x, ...)
  ```

  ```r
  ## S3 method for class 'data.frame'
  keep.labels(x, ...)
  ```

  ```r
  ## Default S3 method:
  keep.labels(x, ...)
  ```

  ```r
  ## S3 method for class 'keep_labels'
  x[...]
  ```

  ```r
  ## S3 replacement method for class 'keep_labels'
  x[i] <- value
  ```

  `loosen.labels(x, ...)"
## S3 method for class 'data.frame'
loosen.labels(x, ...)

## Default S3 method:
loosen.labels(x, ...)

### Arguments

x  
An R object

...  
Other arguments (not in use at this time).

i, value  
See `[<-`.

### Value

A copy of x with a "keep_labels" class appended on or removed. Note that for the data.frame method, only classes on the columns are changed; the data.frame won't have an extra class appended. This is different from previous versions of arsenal.

### Author(s)

Ethan Heinzen

### See Also

labels

---

## Description

Assign and extract the 'label' attribute on an R object. `set_labels` is the same as `labels(x) <- value` but returns x for use in a pipe chain. `set_attr` is the same as `attr(x, which) <- value` but returns x for use in a pipe chain.

### Usage

```r
## S3 method for class 'data.frame'
labels(object, ...)

## S3 method for class 'keep_labels'
labels(object, ...)

labels(x) <- value

## S3 replacement method for class 'keep_labels'
```
mdy.Date

convert_numeric_dates_to_date_object, and vice versa

Convert numeric dates for month, day, and year to Date object, and vice versa.

\[
\text{labels}(x) <- \text{value}
\]

## Default S3 replacement method:
labels(x) <- value

## S3 replacement method for class 'data.frame'
labels(x) <- value

set_labels(x, value)

set_attr(x, which, value)

Arguments

... Other arguments (not in use at this time).
x, object An R object.
value A vector or list containing labels to assign. Labels are assigned based on names, if available; otherwise, they're assigned in order. Can pass NULL to remove all labels.
which See \text{attr}<-

Details

The \text{data.frame} methods put labels on and extract labels from the columns of object.

Value

The labels of object, or object with new labels.

Author(s)

Ethan Heinzen

See Also

keep.labels

mdy.Date

Convert numeric dates to Date object, and vice versa
Usage

`mdy.Date(month, day, year, yearcut = 120)`

`Date.mdy(date)`

`is.Date(x)`

Arguments

- **month**: integer, month (1-12).
- **day**: integer, day of the month (1-31, depending on the month).
- **year**: integer, either 2- or 4-digit year. If two-digit number, will add 1900 onto it, depending on range.
- **yearcut**: cutoff for method to know if to convert to 4-digit year.
- **date**: A date value.
- **x**: An object.

Details

Test if an object is a date.

More work may need to be done with yearcut and 2-digit years. Best to give a full 4-digit year.

Value

`mdy.Date` returns a Date object, and `Date.mdy` returns a list with integer values for month, day, and year. `is.Date` returns a single logical value.

See Also

`Date, DateTimeClasses`

Examples

```r
mdy.Date(9, 2, 2013)

tmp <- mdy.Date(9, 2, 2013)
Date.mdy(tmp)

is.Date(tmp)
```
Mock study data for examples

Description
Mock clinical study data for examples to test data manipulation and statistical functions. The function `muck_up_mockstudy()` is used in examples for `comparedf`.

Usage
```r
mockstudy
muck_up_mockstudy()
```

Format
A data frame with 1499 observations on the following 15 variables:

- `case` a numeric identifier-patient ID
- `age` age in years
- `arm` treatment arm divided into 3 groups, character string
- `sex` a factor with levels Male Female
- `race` self-reported race/ethnicity, character string
- `fu.time` survival or censoring time in years
- `fu.stat` censoring status; 1=censor, 2=death
- `ps` integer, ECOG performance score
- `hgb` numeric, hemoglobin count
- `bmi` numeric, body mass index, kg/m^2
- `alk.phos` numeric, alkaline phosphatase
- `ast` numeric, aspartate transaminase
- `mdquality.s` integer, LASA QOL 0=Clinically Deficient, 1=Not Clinically Deficient
- `age.ord` an ordered factor split of age, with levels 10-19 < 20-29 < 30-39 < 40-49 < 50-59 < 60-69 < 70-79 < 80-89

An object of class `data.frame` with 1499 rows and 14 columns.

Examples
```r
data(mockstudy)
str(mockstudy)
```
**modelsum**

*Fit models over each of a set of independent variables with a response variable*

---

**Description**

Fit and summarize models for each independent (x) variable with a response variable (y), with options to adjust by variables for each model.

**Usage**

```r
modelsum(
  formula,
  family = "gaussian",
  data,
  adjust = NULL,
  na.action = NULL,
  subset = NULL,
  weights = NULL,
  id,
  strata,
  control = NULL,
  ...
)
```

**Arguments**

- `formula`: an object of class `formula`; a symbolic description of the variables to be modeled. See "Details" for more information.
- `family`: a similar mechanism to `glm`, where the model to be fit is driven by the family. Options include: binomial, gaussian, survival, poisson, negbin, clog, and ordinal. These can be passed as a string, as a function, or as a list resulting from a call to one of the functions. See `modelsum.family` for details on survival, ordinal, negbin, and clog families.
- `data`: an optional data.frame, list or environment (or object coercible by `as.data.frame` to a data frame) containing the variables in the model. If not found in `data`, the variables are taken from `environment(formula)`, typically the environment from which `modelsum` is called.
- `adjust`: an object of class `formula` or a list of formulas, listing variables to adjust by in all models. Specify as a one-sided formula, like: `~Age+ Sex`. If a list, the names are used for the summary function. Unadjusted models can be specified as `~ 1` or as a list: `list(Unadjusted = NULL)`.
- `na.action`: a function which indicates what should happen when the data contain NAs. The default (`NULL`) is to use the defaults of `lm`, `glm`, or `coxph`, depending on the family specifications.
subset: an optional vector specifying a subset of observations (rows of data) to be used in the results. If strata is missing, this works as vector of logicals or an index; otherwise, it should be a logical vector.

weights: an optional vector specifying the weights to apply to each data observation (rows of data)

id: A vector to identify clusters. Only used for relrisk at this time.

strata: a vector of strata to separate model summaries by an additional group. Note that for families like "clog", the "usual" strata term to indicate subject groupings should be given in the adjust argument.

control: control parameters to handle optional settings within modelsum. Arguments for modelsum.control can be passed to modelsum via the ... argument, but if a control object and ... arguments are both supplied, the latter are used. See modelsum.control for other details.

...: additional arguments to be passed to internal modelsum functions.

Value

An object with class c("modelsum","arsenal_table")

Author(s)

Jason Sinnwell, Patrick Votruba, Beth Atkinson, Gregory Dougherty, and Ethan Heinzen, adapted from SAS Macro of the same name

See Also

arsenal_table, modelsum.control, summary.modelsum, modelsum.internal, formulize

Examples

data(mockstudy)

  tab1 <- modelsum(bmi ~ sex + age, data = mockstudy)
  summary(tab1, text = TRUE)

  tab2 <- modelsum(alk.phos ~ arm + ps + hgb, adjust = ~ age + sex,
                   family = "gaussian", data = mockstudy)
  summary(tab2, text = TRUE)

  summary(tab2, show.intercept = FALSE, text = TRUE)

  tab2.df <- as.data.frame(tab2)

  tab2.df[1:5,]
Control settings for modelsum function

Description

Control test and summary settings for `modelsum` function.

Usage

```r
modelsum.control(
digits = 3L,
digits.ratio = 3L,
digits.p = 3L,
format.p = TRUE,
show.adjust = TRUE,
show.intercept = TRUE,
conf.level = 0.95,
ordinal.stats = c("OR", "CI.lower.OR", "CI.upper.OR", "p.value", "Nmiss"),
binomial.stats = c("OR", "CI.lower.OR", "CI.upper.OR", "p.value", "concordance", 
             "Nmiss"),
gaussian.stats = c("estimate", "std.error", "p.value", "adj.r.squared", "Nmiss"),
poisson.stats = c("RR", "CI.lower.RR", "CI.upper.RR", "p.value", "Nmiss"),
negbin.stats = c("RR", "CI.lower.RR", "CI.upper.RR", "p.value", "Nmiss"),
relrisk.stats = c("RR", "CI.lower.RR", "CI.upper.RR", "p.value", "Nmiss"),
clog.stats = c("OR", "CI.lower.OR", "CI.upper.OR", "p.value", "concordance", "Nmiss"),
survival.stats = c("HR", "CI.lower.HR", "CI.upper.HR", "p.value", "concordance", 
             "Nmiss"),
stat.labels = list(),
... )
```

Arguments

digits
  Numeric, denoting the number of digits after the decimal point for beta coefficients and standard errors.
digits.ratio
  Numeric, denoting the number of digits after the decimal point for ratios, e.g. OR, RR, HR.
digits.p
  Numeric, denoting the number of digits for p-values. See "Details", below.
format.p
  Logical, denoting whether to format p-values. See "Details", below.
show.adjust
  Logical, denoting whether to show adjustment terms.
show.intercept
  Logical, denoting whether to show intercept terms.
conf.level
  Numeric, giving the confidence level.
ordinal.stats
  Character vectors denoting which stats to show for the various model types.
binomial.stats
  ...  Logical, denoting whether to show adjustment terms.
survival.stats
  ...  Logical, denoting whether to show intercept terms.
poisson.stats
  ...  Numeric, giving the confidence level.
negbin.stats
  ...  Character vectors denoting which stats to show for the various model types.
clog.stats
  ...  A named list of labels for all the stats used above.
survival.stats
  ...  Other arguments (not in use at this time).
Details

If `format.p` is FALSE, `digits.p` denotes the number of significant digits shown. The p-values will be in exponential notation if necessary. If `format.p` is TRUE, `digits.p` will determine the number of digits after the decimal point to show. If the p-value is less than the resulting number of places, it will be formatted to show so.

Value

A list with settings to be used within the `modelsum` function.

See Also

`modelsum`, `summary.modelsum`, `modelsum.internal`

---

Description

A set of family functions for `modelsum`.

Usage

```r
survival()
ordinal(method = c("logistic", "probit", "loglog", "cloglog", "cauchit"))
negbin(link = c("log", "identity", "sqrt"))
clog()
relrisk(link = "log")
```

Arguments

- `method`: See `MASS::polr`.
- `link`: See `MASS::glm.nb`.

Value

A list, in particular with element `family`.

See Also

`family`, `coxph`, `polr`
modelsum.internal  Helper functions for modelsum

Description

A set of helper functions for modelsum.

Usage

is.modelsum(x)

is.summary.modelsum(x)

na.modelsum(object, ...)

Arguments

x  A modelsum object.
object  A data.frame resulting from evaluating a modelsum formula.
...  Other arguments, or a vector of indices for extracting.

Value

na.modelsum returns a subsetted version of object (with attributes).

See Also

arsenal_table

NA.operations  Some functions to handle NAs

Description

allNA tests if all elements are NA, and includeNA sets the NAs in a character vector or factor to an explicit label.

Usage

allNA(x)

includeNA(x, label, ...)

## S3 method for class 'factor'
includeNA(x, label = "(Missing)", first = FALSE, ...)

## Default S3 method:
includeNA(x, label = "(Missing)", ...)
Arguments

- **x**: An object
- **label**: A character string denoting the label to set NAs to.
- **...**: Other arguments (not in use at this time).
- **first**: Logical; should the new label be the first level?

Author(s)

Ethan Heinzen

See Also

- `is.na`, `anyNA`

---

**padjust**  
*Adjust P-values for Multiple Comparisons*

Description

Adjust P-values for Multiple Comparisons

Usage

```r
padjust(p, method, n, ...)  
## Default S3 method:  
padjust(p, method, n, ...)  
## S3 method for class 'tableby'  
padjust(p, method, n, suffix = " (adjusted for multiple comparisons)", ...)  
## S3 method for class 'summary.tableby'  
padjust(p, method, n, suffix = " (adjusted for multiple comparisons)", ...)  
```

Arguments

- **p**: An object.
- **method**: correction method. Can be abbreviated.
- **n**: number of comparisons, must be at least `length(p)`; only set this (to non-default) when you know what you are doing!
- **...**: Other arguments.
- **suffix**: A suffix to add to the footnotes indicating that the tests were adjusted.

See Also

- `p.adjust`, `modpval.tableby`, `tests.tableby`
paired

Summary Statistics of a Set of Independent Variables Paired Across Two Timepoints

Description
Summarize one or more variables (x) by a paired time variable (y). Variables on the right side of the formula, i.e. independent variables, are summarized by the two time points on the left of the formula. Optionally, an appropriate test is performed to test the distribution of the independent variables across the time points.

Usage
paired(
  formula,
  data,
  id,
  na.action,
  subset = NULL,
  strata,
  control = NULL,
  ...
)

Arguments

formula an object of class formula of the form time ~ var1 + .... See "Details" for more information.

data an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which the function is called.

id The vector giving IDs to match up data for the same subject across two time-points.

na.action a function which indicates what should happen when the data contain NAs. The default is na.paired("in.both"). See na.paired for more details

subset an optional vector specifying a subset of observations (rows of data) to be used in the results. Works as vector of logicals or an index.

strata a vector of strata to separate summaries by an additional group.

control control parameters to handle optional settings within paired. Two aspects of paired are controlled with these: test options of RHS variables and x variable summaries. Arguments for paired.control can be passed to paired via the ... argument, but if a control object and ... arguments are both supplied, the latter are used. See paired.control for more details.

... additional arguments to be passed to internal paired functions or paired.control.
**Details**

Do note that this function piggybacks off of `tableby` quite heavily, so there is no `summary.paired` function (for instance).

These tests are accepted:

- `paired.t`: a paired t-test.
- `mcnemar`: McNemar's test.
- `signed.rank`: a signed rank test.
- `sign.test`: a sign test.
- `notest`: no test is performed.

**Value**

An object with class `c("paired","tableby","arsenal_table")`

**Author(s)**

Jason Sinnwell, Beth Atkinson, Ryan Lennon, and Ethan Heinzen

**See Also**

`arsenal_table`, `paired.control`, `tableby`, `formulize`, `selectall`

---

**paired.control**  
*Control settings for paired function*

**Description**

Control test and summary settings for the `paired` function.

**Usage**

```r
paired.control(
  diff = TRUE,
  numeric.test = "paired.t",
  cat.test = "mcnemar",
  ordered.test = "signed.rank",
  date.test = "paired.t",
  mcnemar.correct = TRUE,
  signed.rank.exact = NULL,
  signed.rank.correct = TRUE,
  ...
)
```
Arguments

diff logical, telling paired whether to calculate a column of differences between time points.

numeric.test name of test for numeric RHS variables in paired: paired.t, signed.rank, sign.test.

cat.test name of test for categorical variables: mcnemar

ordered.test name of test for ordered variables: signed.rank, sign.test

date.test name of test to perform for date variables: paired.t, signed.rank, sign.test

mcnemar.correct, signed.rank.exact, signed.rank.correct

Options for statistical tests. See wilcox.test and mcnemar.test for details.

... Arguments passed to tableby.control

Details

Note that (with the exception of total) all arguments to tableby.control are accepted in this function (in fact, this function passes everything through to tableby.control). However, there are different defaults for the statistical tests (shown here). For details on the other arguments, please see the help page for tableby.control.

Value

A list with settings to be used within the paired function.

Author(s)

Ethan Heinzen

See Also

paired, tableby, tableby.control, summary.tableby

---

paired.internal Helper functions for paired

Description

A set of helper functions for paired.

Usage

na.paired(missings = c("in.both", "fill", "asis"))

Arguments

missings A character string denoting which action to take. See "Details", below.
Details

All methods subset out any NA time points or IDs. "in both" (the default) subsets the data.frame to individuals who appear at both time points. "fill" adds explicit missings for the people missing second time points. "asis" does nothing to add or remove missings.

Value

`na.paired` returns a function used to subset data.frames in `paired`.

See Also

tableby.internal

selectall Make a column for "select all" input

Description

Make a column for "select all" input

Usage

`selectall(...)`

`as.selectall(x)`

```r
## S3 method for class 'selectall'
as.matrix(x, ...)

## S3 method for class 'selectall'
x[i, j, drop = FALSE]

## S3 method for class 'selectall'
is.na(x)

is.selectall(x)
```

Arguments

`...`  Named arguments of the same length. These should be logical, numeric (0/1) or a factor with two levels.

`x`  An object of class "selectall"

`i, j, drop`  Arguments to `[.matrix`

See Also

tableby.paired
Examples

```r
d <- data.frame(grp = rep(c("A", "B"), each = 5))
d$s <- selectall(
  'Option 1' = c(rep(1, 4), rep(0, 6)),
  'Option 2' = c(0, 1, 0, 0, 1, 1, 0, 0),
  'Option 3' = 1,
  'Option 4' = 0
)
summary(tableby(grp ~ s, data = d), text = TRUE)
```

### summary.comparedf

The summary method for a comparedf object

#### Description

Print a more detailed output of the comparedf object.

#### Usage

```r
## S3 method for class 'comparedf'
summary(object, ..., show.attrs = FALSE)

## S3 method for class 'summary.comparedf'
print(x, ..., format = "pandoc")
```

#### Arguments

- `object`: An object of class "comparedf", as made by the comparedf S3 method.
- `...`: Other arguments passed to comparedf.control. In print, these are passed to kable.
- `show.attrs`: Logical, denoting whether to show the actual attributes which are different. For (e.g.) factors with lots of levels, this can make the tables quite wide, so this feature is FALSE by default.
- `x`: An object returned by the summary.comparedf function.
- `format`: Passed to kable: the format for the table. The default here is "pandoc". To use the default in kable, pass NULL.

#### Value

An object of class "summary.comparedf" is returned.

#### See Also

comparedf, comparedf.control
Description

Summarize the freqlist object.

Usage

```r
## S3 method for class 'freqlist'
summary(object, ..., labelTranslations = NULL, title = NULL)

## S3 method for class 'summary.freqlist'
as.data.frame(x, ..., list.ok = FALSE)
```

Arguments

- **object**: an object of class `freqlist`
- **...**: For `summary.freqlist`, these are passed to `as.data.frame.freqlist` (and hence to `freq.control`). For the print method, these are additional arguments passed to the `kable` function.
- **labelTranslations**: A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., `list(age = "Age(Years)", meansd = "Mean(SD)")`.
- **title**: Title/caption for the table, defaulting to `NULL` (no title). Passed to `kable`. Can be length > 1 if the more than one table is being printed.
- **x**: An object of class `summary.freqlist`.
- **list.ok**: If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If `FALSE` but there are multiple by-variables, a warning is issued.

Value

An object of class "summary.freqlist" (invisibly for the print method).

Author(s)

Tina Gunderson, with major revisions by Ethan Heinzen

See Also

`freqlist, table, xtabs, kable, freq.control, freqlist.internal`
Examples

```r
# load mockstudy data
data(mockstudy)
tab.ex <- table(mockstudy[c("arm", "sex", "mdquality.s")], useNA = "ifany")
noby <- freqlist(tab.ex, na.options = "include")
summary(noby)
withby <- freqlist(tab.ex, strata = c("arm","sex"), na.options = "showexclude")
summary(withby)
summary(withby, dupLabels = TRUE)
```

---

**summary.modelsum**

*Summarize a modelsum object.*

**Description**

Format the information in object as a table using Pandoc coding or plain text, and cat it to stdout.

**Usage**

```r
## S3 method for class 'modelsum'
summary(
  object,
  ...,
  labelTranslations = NULL,
  text = FALSE,
  title = NULL,
  term.name = "",
  adjustment.names = FALSE
)

## S3 method for class 'summary.modelsum'
as.data.frame(
  x,
  ...,
  text = x$text,
  term.name = x$term.name,
  adjustment.names = x$adjustment.names,
  width = NULL,
  min.split = NULL,
  list.ok = FALSE
)
```

**Arguments**

- `object` *A modelsum object.*
For `summary.modelsum`, other arguments passed to `as.data.frame.modelsum`. For `as.data.frame.summary.modelsum`, "width" and "min.split" are passed to `smart.split`. For printing the summary object, these are passed to both `as.data.frame.summary.modelsum` and `kable`.

### labelTranslations

A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., `list(age = "Age(Years)", meansd = "Mean(SD)")`.

### text

An argument denoting how to print the summary to the screen. Default is FALSE (show markdown output). `TRUE` and `NULL` output a text-only version, with the latter avoiding all formatting. "html" uses the HTML tag `<strong>` instead of the markdown formatting, and "latex" uses the LaTeX command `\textbf`.

### title

Title/caption for the table, defaulting to NULL (no title). Passed to `kable`. Can be length > 1 if the more than one table is being printed.

### term.name

A character vector denoting the column name for the "terms" column. It should be the same length as the number of tables or less (it will get recycled if needed). The special value `TRUE` will use the y-variable’s label for each table.

### adjustment.names

Logical, denoting whether the names of the adjustment models should be printed.

### x

An object of class "summary.modelsum".

### width

Passed to `smart.split` for formatting of the "term" column.

### min.split

Passed to `smart.split` for formatting of the "term" column.

### list.ok

If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.

### Value

An object of class "summary.modelsum"

### Author(s)

Ethan Heinzen, based on code originally by Greg Dougherty

### See Also

`modelsum, as.data.frame.modelsum`
The summary method for a `tableby` object, which is a pretty rendering of a `tableby` object into a publication-quality results table in R Markdown, and can render well in text-only.

### Usage

```r
## S3 method for class 'tableby'
summary(
  object,
  ..., labelTranslations = NULL,
  text = FALSE,
  title = NULL,
  pfootnote = FALSE,
  term.name = ""
)

## S3 method for class 'summary.tableby'
as.data.frame(
  x,
  ..., text = x$text,
  pfootnote = x$pfootnote,
  term.name = x$term.name,
  width = NULL,
  min.split = NULL,
  list.ok = FALSE
)
```

### Arguments

- **object**: An object of class "tableby", made by the `tableby` function.
- **...**: For `summary.tableby`, other arguments passed to `as.data.frame.tableby`. For printing the summary object, these are passed to both `as.data.frame.summary.tableby` and `kable`.
- **labelTranslations**: A named list (or vector) where the name is the label in the output to be replaced in the pretty rendering by the character string value for the named element of the list, e.g., `list(age = "Age(Years)", meansd = "Mean(SD)")`.
- **text**: An argument denoting how to print the summary to the screen. Default is `FALSE` (show markdown output). `TRUE` and `NULL` output a text-only version, with the latter avoiding all formatting. "html" uses the HTML tag `<strong>` instead of the markdown formatting, and "latex" uses the LateX command `\textbf`.
**summary.tableby**

- **title**: Title/caption for the table, defaulting to NULL (no title). Passed to `kable`. Can be length > 1 if the more than one table is being printed.

- **pfootnote**: Logical, denoting whether to put footnotes describing the tests used to generate the p-values. Alternatively, "html" to surround the outputted footnotes with `<li>`.

- **term.name**: A character vector denoting the column name for the "terms" column. It should be the same length as the number of tables or less (it will get recycled if needed). The special value TRUE will use the y-variable’s label for each table.

- **x**: An object of class "summary.tableby".

- **width**: Passed to `smart.split` for formatting of the "term" column.

- **min.split**: Passed to `smart.split` for formatting of the "term" column.

- **list.ok**: If the object has multiple by-variables, is it okay to return a list of data.frames instead of a single data.frame? If FALSE but there are multiple by-variables, a warning is issued.

**Value**

An object of class `summary.tableby`

**Author(s)**

Ethan Heinzen, based on code by Gregory Dougherty, Jason Sinnwell, Beth Atkinson, adapted from SAS Macros written by Paul Novotny and Ryan Lennon

**See Also**

`tableby.control`, `tableby`

**Examples**

```r
set.seed(100)
## make 3+ categories for response
nsubj <- 90
mdat <- data.frame(Response=sample(c(1,2,3),nsubj, replace=TRUE),
                     Sex=sample(c("Male", "Female"), nsubj,replace=TRUE),
                     Age=round(rnorm(nsubj,mean=40, sd=5)),
                     HtIn=round(rnorm(nsubj,mean=65,sd=5)))

## allow default summaries on RHS variables
out <- tableby(Response ~ Sex + Age + HtIn, data=mdat)
summary(out, text=TRUE)
labels(out)
labels(out) <- c(Age="Age (years)", HtIn="Height (inches)"

summary(out, stats.labels=c(meansd="Mean-SD", q1q3 = "Q1-Q3"), text=TRUE)
```
tableby

Summary Statistics of a Set of Independent Variables by a Categorical Variable

Description

Summarize one or more variables (x) by a categorical variable (y). Variables on the right side of the formula, i.e. independent variables, are summarized by the levels of a categorical variable on the left of the formula. Optionally, an appropriate test is performed to test the distribution of the independent variables across the levels of the categorical variable.

Usage

\begin{verbatim}
tableby(
    formula,
    data,
    na.action=
    subset = NULL,
    weights = NULL,
    strata =
    control = NULL,
    ...
)
\end{verbatim}

Arguments

- **formula**: an object of class `formula`; a symbolic description of the variables to be summarized by the group, or categorical variable, of interest. See "Details" for more information. To only view overall summary statistics, a one-sided formula can be used.
- **data**: an optional data frame, list or environment (or object coercible by `as.data.frame` to a data frame) containing the variables in the model. If not found in data, the variables are taken from `environment(formula)`, typically the environment from which the function is called.
- **na.action**: a function which indicates what should happen when the data contain NAs. The default is `na.tableby(TRUE)` if there is a by-variable, and `na.tableby(FALSE)` if there is not. This schema thus includes observations with NAs in x variables, but removes those with NA in the categorical group variable and strata (if used).
- **subset**: an optional vector specifying a subset of observations (rows of data) to be used in the results. Works as vector of logicals or an index.
- **weights**: a vector of weights. Using weights will disable statistical tests.
- **strata**: a vector of strata to separate summaries by an additional group.
- **control**: control parameters to handle optional settings within `tableby`. Two aspects of `tableby` are controlled with these: test options of RHS variables across levels of the categorical grouping variable, and x variable summaries within the grouping
variable. Arguments for `tableby.control` can be passed to `tableby` via the `...` argument, but if a control object and `...` arguments are both supplied, the latter are used. See `tableby.control` for more details.

... additional arguments to be passed to internal `tableby` functions or `tableby.control`.

Details

The group variable (if any) is categorical, which could be an integer, character, factor, or ordered factor. `tableby` makes a simple summary of the counts within the k-levels of the independent variables on the right side of the formula. Note that unused levels are dropped.

The `data` argument allows data.frames with label attributes for the columns, and those labels will be used in the summary methods for the `tableby` class.

The independent variables are a mixture of types: categorical (discrete), numeric (continuous), and time to event (survival). These variables are split by the levels of the group variable (if any), then summarized within those levels, specific to the variable type. A statistical test is performed to compare the distribution of the independent variables across the levels of the grouping variable.

The tests differ by the independent variable type, but can be specified explicitly in the formula statement or in the control function. These tests are accepted:

- `anova`: analysis of variance test; the default test for continuous variables. When LHS variable has two levels, equivalent to two-sample t-test.
- `kwt`: Kruskal-Wallis Rank Test, optional test for continuous variables. When LHS variable has two levels, equivalent to Wilcoxon test.
- `wt`: An explicit Wilcoxon test.
- `chisq`: chi-square goodness of fit test for equal counts of a categorical variable across categories; the default for categorical or factor variables
- `fe`: Fisher’s exact test for categorical variables
- `trend`: trend test for equal distribution of an ordered variable across a categorical variable; the default for ordered factor variables
- `logrank`: log-rank, the default for time-to-event variables
- `notest`: no test is performed.

To perform a mixture of asymptotic and rank-based tests on two different continuous variables, an example formula is: `formula = group ~ anova(age) + kwt(height)`. The test settings in `tableby.control` apply to all independent variables of a given type.

The summary statistics reported for each independent variable within the group variable can be set in `tableby.control`.

Finally, multiple by-variables can be set using `list()`. See the examples for more details.

Value

An object with class `c("tableby","arsenal_table")`

Author(s)

Jason Sinnwell, Beth Atkinson, Gregory Dougherty, and Ethan Heinzen, adapted from SAS Macros written by Paul Novotny and Ryan Lennon

tableby.control Control settings for tableby function

Description

Control test and summary settings for the `tableby` function.

Usage

tableby.control(
  test = TRUE,
  total = TRUE,
  total.pos = c("after", "before"),
  test.pname = NULL,
  numeric.simplify = FALSE,
  cat.simplify = FALSE,
  cat.droplevels = FALSE,
  ordered.simplify = FALSE,
  date.simplify = FALSE,
  numeric.test = "anova",
  cat.test = "chisq",
  ordered.test = "trend",
  surv.test = "logrank",
  date.test = "kwt",
)
tableby.control 45

```r
selectall.test = "notest",
test.always = FALSE,
numeric.stats = c("Nmiss", "meansd", "range"),
cat.stats = c("Nmiss", "countpct"),
ordered.stats = c("Nmiss", "countpct"),
surv.stats = c("Nmiss", "Nevents", "medSurv"),
date.stats = c("Nmiss", "median", "range"),
selectall.stats = c("Nmiss", "countpct"),
stats.labels = list(),
digits = 3L,
digits.count = 0L,
digits.pct = 1L,
digits.p = 3L,
format.p = TRUE,
digits.n = 0L,
conf.level = 0.95,
wilcox.correct = FALSE,
wilcox.exact = NULL,
chisq.correct = FALSE,
simulate.p.value = FALSE,
B = 2000,
times = 1:5,
...
)
```

**Arguments**

- **test** logical, telling `tableby` whether to perform tests of x variables across levels of the group variable.
- **total** logical, telling `tableby` whether to calculate a column of totals across group variable.
- **total.pos** One of "before" or "after", denoting where to put the total column relative to the by-variable columns.
- **test.pname** character string denoting the p-value column name in `summary.tableby`. Modifiable also with `modpval.tableby`.
- **numeric.simplify** logical, tell `tableby` whether to condense numeric/date output to a single line. NOTE: this only simplifies to one line if there is only one statistic reported, such as `meansd`. In particular, if `Nmiss` is specified and there are missings, then the output is not simplified.
- **cat.simplify**, **ordered.simplify** logical, tell `tableby` whether to remove the first level of the categorical/ordinal variable if binary. If TRUE, only the summary stats of the second level are reported (unless there's only one level, in which case it's reported). If "label", the second level's label is additionally appended to the label. NOTE: this only simplifies to one line if there is only one statistic reported, such as `countpct`. In particular, if `Nmiss` is specified and there are missings, then the output is not simplified.
cat.droplevels: Should levels be dropped for categorical variables? If set to true, p-values will not be displayed unless test.always = TRUE as well.

numeric.test: name of test for numeric RHS variables in tableby: anova, kwt (Kruskal-Wallis). If no LHS variable exists, then a mean is required for a univariate test.

cat.test: name of test for categorical variables: chisq, fe (Fisher's Exact)

ordered.test: name of test for ordered variables: trend

surv.test: name of test for survival variables: logrank

date.test: name of test for date variables: kwt

selectall.test: name of test for date variables: notest

test.always: Should the test be performed even if one or more by-group has 0 observations? Relevant for kwt and anova.

numeric.stats, cat.stats, ordered.stats, surv.stats, date.stats, selectall.stats: summary statistics to include for the respective class of RHS variables within the levels of the group LHS variable.

stats.labels: A named list of labels for all the statistics function names, where the function name is the named element in the list and the value that goes with it is a string containing the formal name that will be printed in all printed renderings of the output, e.g., list(countpct="Count (Pct)"). Any unnamed elements will be ignored. Passing NULL will disable labels.

digits: Number of decimal places for numeric values.

digits.count: Number of decimal places for count values.

digits.pct: Number of decimal places for percents.

digits.p: Number of decimal places for p-values.

format.p: Logical, denoting whether to format p-values. See "Details", below.

digits.n: Number of decimal places for N's in the header. Set it to NA to suppress the N's.

conf.level: Numeric, denoting what confidence level to use for confidence intervals. (See, e.g., \texttt{binomCI})

wilcox.correct, wilcox.exact: See \texttt{wilcox.test}

chisq.correct: logical, correction factor for chisq.test

simulate.p.value: logical, simulate p-value for categorical tests (fe and chisq)

B: number of simulations to perform for simulation-based p-value

times: A vector of times to use for survival summaries.

...: additional arguments.
Details

All tests can be turned off by setting test to FALSE. Otherwise, test are set to default settings in this list, or set explicitly in the formula of tableby.

If format.p is FALSE, digits.p denotes the number of significant digits shown. The p-values will be in exponential notation if necessary. If format.p is TRUE, digits.p will determine the number of digits after the decimal point to show. If the p-value is less than the resulting number of places, it will be formatted to show so.

Options for statistics are described more thoroughly in the vignette and are listed in tableby.stats.

Value

A list with settings to be used within the tableby function.

### tableby.internal

**Helper functions for tableby**

**Description**

A set of helper functions for tableby.
Usage

is.tableby(x)

is.summary.tableby(x)

modpval.tableby(x, pdata, use.pname = FALSE)

tests(x)

## S3 method for class 'tableby'

tests(x)

na.tableby(lhs = TRUE)

## S3 method for class 'tableby'

xtfrm(x)

## S3 method for class 'tableby'

sort(x, ...)

## S3 method for class 'tableby'

Ops(e1, e2)

## S3 method for class 'tableby'

head(x, n = 6L, ...)

## S3 method for class 'tableby'

tail(x, n = 6L, ...)

Arguments

x A tableby object.

pdata A named data.frame where the first column is the by-variable names, the (opti-
tional) second is the strata value, the next is the x variable names, the next is
p-values (or some test stat), and the (optional) next column is the method name.

use.pname Logical, denoting whether the column name in pdata corresponding to the p-
values should be used in the output of the object.

lhs Logical, denoting whether to remove NAs from the first column of the data.frame
(the "left-hand side")

... Other arguments.

e1, e2 tableby objects, or numbers to compare them to.

n A single integer. See head or tail for more details

Details

Logical comparisons are implemented for Ops.tableby.
**Value**

na.tableby returns a subsetted version of object (with attributes). Ops.tableby returns a logical vector. xtfrm.tableby returns the p-values (which are ordered by order to sort).

**See Also**

arsenal_table, sort, head, tail, tableby, summary.tableby, tableby.control

**tableby.stats**

*tableby Summary Statistics Functions*

**Description**

A collection of functions that will report summary statistics. To create a custom function, consider using a function with all three arguments and .... See the tableby vignette for an example.

**Usage**

arsenal_sum(x, na.rm = TRUE, ...)

arsenal_min(x, na.rm = TRUE, ...)

arsenal_max(x, na.rm = TRUE, ...)

arsenal_mean(x, na.rm = TRUE, weights = NULL, ...)

arsenal_sd(x, na.rm = TRUE, weights = NULL, ...)

arsenal_var(x, na.rm = TRUE, weights = NULL, ...)

meansd(x, na.rm = TRUE, weights = NULL, ...)

meanse(x, na.rm = TRUE, weights = NULL, ...)

meanCI(x, na.rm = TRUE, weights = NULL, conf.level = 0.95, ...)

medianrange(x, na.rm = TRUE, weights = NULL, ...)

medianmad(x, na.rm = TRUE, weights = NULL, ...)

arsenal_median(x, na.rm = TRUE, weights = NULL, ...)

arsenal_range(x, na.rm = TRUE, ...)

gmean(x, na.rm = TRUE, weights = NULL, ...)

gsd(x, na.rm = TRUE, weights = NULL, ...)
gmeansd(x, na.rm = TRUE, weights = NULL, ...)
gmeanCI(x, na.rm = TRUE, weights = NULL, conf.level = 0.95, ...)
Nevents(x, na.rm = TRUE, weights = NULL, ...)
medSurv(x, na.rm = TRUE, weights = NULL, ...)
NeventsSurv(x, na.rm = TRUE, weights = NULL, times = 1:5, ...)
NriskSurv(x, na.rm = TRUE, weights = NULL, times = 1:5, ...)
Nrisk(x, na.rm = TRUE, weights = NULL, times = 1:5, ...)
medTime(x, na.rm = TRUE, weights = NULL, ...)
q1q3(x, na.rm = TRUE, weights = NULL, ...)
medianq1q3(x, na.rm = TRUE, weights = NULL, ...)
iqr(x, na.rm = TRUE, weights = NULL, ...)
Nmiss(x, na.rm = TRUE, weights = NULL, ...)
Nmiss2(x, na.rm = TRUE, weights = NULL, ...)
N(x, na.rm = TRUE, weights = NULL, ...)

Npct(
x,
  levels = NULL,
  by,
  by.levels = sort(unique(by)),
  na.rm = TRUE,
  weights = NULL,
  ...
  ,
  totallab = "Total"
)
count(x, levels = NULL, na.rm = TRUE, weights = NULL, ...)
countpct(x, levels = NULL, na.rm = TRUE, weights = NULL, ...)
countN(x, levels = NULL, na.rm = TRUE, weights = NULL, ...)
countrowpct(
x,
levels = NULL,
by,
by.levels = sort(unique(by)),
na.rm = TRUE,
weights = NULL,
..., 
totallab = "Total"
)

countcellpct(
  x,
  levels = NULL,
  by,
  by.levels = sort(unique(by)),
  na.rm = TRUE,
  weights = NULL,
  ..., 
totallab = "Total"
)

binomCI(x, levels = NULL, na.rm = TRUE, weights = NULL, conf.level = 0.95, ...)

rowbinomCI(
  x,
  levels = NULL,
  by,
  by.levels = sort(unique(by)),
  na.rm = TRUE,
  weights = NULL,
  conf.level = 0.95,
  ..., 
totallab = "Total"
)

Arguments

x Usually a vector.
na.rm Should NAs be removed?
... Other arguments.
weights A vector of weights.
conf.level Numeric, denoting what confidence level to use for confidence intervals.
times A vector of times to use for survival summaries.
levels A vector of levels that character xs should have.
by a vector of the by-values.
by.levels a vector of the levels of by.
totallab What to call the total "column"
Details

Not all these functions are exported, in order to avoid conflicting NAMESPACES. Note also that the functions prefixed with "arsenal_" can be referred to by their short names (e.g., "min" for "arsenal_min").

Value

Usually a vector of the appropriate numbers.

See Also

includeNA, tableby.control

description

A collection of functions that may help users create custom functions that are formatted correctly.

Usage

as.tbstat(
  x,
  oldClass = NULL,
  sep = NULL,
  parens = NULL,
  sep2 = NULL,
  pct = NULL,
  ...
)

as.countpct(
  x,
  ...,
  which.count = setdiff(seq_along(x), which.pct),
  which.pct = 0L
)

as.tbstat_multirow(x)

Arguments

x Usually a vector.
oldClass class(es) to add to the resulting object.
sep       The separator between x[1] and the rest of the vector.
parens    A length-2 vector denoting parentheses to use around x[2] and x[3].
sep2      The separator between x[2] and x[3].
pct       For statistics of length 2, the symbol to use after the second one. (It’s called "pct" because usually the first statistic is never a percent, but the second often is.)
...       arguments to pass to as.tbstat.
which.count Which statistics are counts? The default is everything except the things that are percents.
which.pct  Which statistics are percents? The default is 0, indicating that none are.

Details

The vignette has an example on how to use these.

as.tbstat defines a tableby statistic with its appropriate formatting.

as.countpct adds another class to as.tbstat to use different "digits" arguments (i.e., digits.count or digits.pct). See tableby.control.

as.tbstat.mutirow marks an object (usually a list) for multiple-row printing.

Description

Functions to output tables to a single document. (Also the S3 backbone behind the write2* functions.)

Usage

write2(object, file, ..., output_format)

## S3 method for class 'arsenal_table'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'summary.arsenal_table'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'comparedf'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'summary.comparedf'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'verbatim'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'yaml'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'code.chunk'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'knitr_kable'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'xtable'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'character'
write2(object, file, ..., output_format = NULL)

## S3 method for class 'list'
write2(
  object,
  file,
  ...,
  append. = FALSE,
  render. = TRUE,
  keep.rmd = !render.,
  output_format = NULL
)

## Default S3 method:
write2(
  object,
  file,
  FUN = NULL,
  ...,
  append. = FALSE,
  render. = TRUE,
  keep.rmd = !render.,
  output_format = NULL
)

Arguments

object     An object.
file       A single character string denoting the filename for the output document.
...         Additional arguments to be passed to FUN, rmarkdown::render, etc. One popular option is to use quiet = TRUE to suppress the command line output.
output_format One of the following:

1. An output format object, e.g. rmarkdown::html_document(...).
write2

2. A character string denoting such a format function, e.g. "html_document". In this case, the "..." are NOT passed.
3. The format function itself, e.g. rmarkdown::html_document. In this case, the "..." arguments are passed.
4. One of "html", "pdf", and "word", shortcuts implemented here. In this case, the "..." arguments are passed.
5. NULL, in which the output is HTML by default.

See rmarkdown::render for details.

append.
Logical, denoting whether (if a temporary .Rmd file of the same name already exists) to append on. Used mostly for write2.list.

render.
Logical, denoting whether to render the temporary .Rmd file. Used mostly for write2.list.

keep.rmd
Logical, denoting whether to keep the intermediate .Rmd file. Used mostly for write2.list.

FUN
The summary-like or print-like function to use to generate the markdown content. Can be passed as a function or a character string. It's expected that FUN(object,...) looks "good" when put directly in a .Rmd file.

Details
write2 is an S3 method. The default prints the object (using print) inside a section surrounded by three back ticks. See verbatim for details.

There are methods implemented for tableby, modelsum, and freqlist, all of which use the summary function. There are also methods compatible with kable, xtable, and pander_return. Another option is to coerce an object using verbatim() to print out the results monospaced (as if they were in the terminal). To output multiple tables into a document, simply make a list of them and call the same function as before. Finally, to output code chunks to be evaluated, use code.chunk.

For more information, see vignette("write2").

Value
object is returned invisibly, and file is written.

Author(s)
Ethan Heinzen, adapted from code from Krista Goergen

See Also
write2word, write2pdf, write2html, render, word_document, html_document, pdf_document, rtf_document, md_document, odt_document

Examples
## Not run:
data(mockstudy)
# tableby example
tab1 <- tableby(arm ~ sex + age, data=mockstudy)
write2(tab1, tempfile(fileext = "rtf"),
  toc = TRUE, # passed to rmarkdown::rtf_document, though in this case it's not practical
  quiet = TRUE, # passed to rmarkdown::render
  title = "My cool new title", # passed to summary.tableby
  output_format = rmarkdown::rtf_document)
write2html(list(
  "# Header 1", # a header
  code.chunk(a <- 1, b <- 2, a + b), # a code chunk
  verbatim("hi there") # verbatim output
),
  tempfile(fileext = "html"),
  quite = TRUE)
## End(Not run)

write2.internal

Helper functions for write2

Description

Helper functions for write2.

Usage

verbatim(...)  

code.chunk(..., chunk.opts = "r")

Arguments

...  

For verbatim, objects to print out monospaced (as if in the terminal). For code.chunk, either expressions or single character strings to paste into the code chunk.

chunk.opts  

A single character string giving the code chunk options. Make sure to specify the engine!

Details

The "verbatim" class is to tell write2 to print the object inside a section surrounded by three back ticks. The results will look like it would in the terminal (monospaced).

code.chunk() is to write explicit code chunks in the .Rmd file; it captures the call and writes it to the file, to execute upon knitting.
Description

Functions to output tables to a single Word, HTML, or PDF document.

Usage

write2word(object, file, ...)
write2pdf(object, file, ...)
write2html(object, file, ...)

Arguments

| object | An object. |
| file | A single character string denoting the filename for the output document. |
| ... | Additional arguments to be passed to FUN, rmarkdown::render, etc. One popular option is to use quiet = TRUE to suppress the command line output. |

Details

To generate the appropriate file type, the write2* functions use one of rmarkdown::word_document, rmarkdown::html_document, and rmarkdown::pdf_document to get the job done. "..." arguments are passed to these functions, too.

Value

object is returned invisibly, and file is written.

Author(s)

Ethan Heinzen, adapted from code from Krista Goergen

See Also

write2

Examples

```r
## Not run:
data(mockstudy)
# tableby example
tab1 <- tableby(arm ~ sex + age, data=mockstudy)
write2html(tab1, "~/trash.html")
```
yaml

Include a YAML header in write2

Description

Include a YAML header in write2

Usage

yaml(...)

## S3 method for class 'yaml'
print(x, ...)

## S3 method for class 'yaml'
c(..., recursive = FALSE)

is.yaml(x)

Arguments

... For yaml(), arguments to be bundled into a list and passed to as.yaml. For
print.yaml(), extra arguments. For c.yaml(), "yaml" objects to be concate-
nated.

x An object of class "yaml".

recursive Not in use at this time.

Value

A text string of class "yaml".

Author(s)

Ethan Heinzen, adapted from an idea by Brendan Broderick
See Also

`as.yaml`, `write2`

Examples

```r
x <- yaml(title = "My cool title", author = "Ethan P Heinzen")
x
y <- yaml("header-includes" = list("\usepackage[labelformat=empty]{caption}"))
y
#%

c(x, y)
```

---

Not in

%nin%

Description

The not-in operator for R.

Usage

```r
x %nin% table
```

Arguments

- `x` vector or NULL: the values to be matched.
- `table` vector or NULL: the values to be matched against.

Value

The negation of `%in%`.

Author(s)

Raymond Moore
