`ahca_polls`*American Health Care Act Polls*

Description

The raw data behind the story "Why The GOP Is So Hell-Bent On Passing An Unpopular Health Care Bill" <https://fivethirtyeight.com/features/why-the-gop-is-so-hell-bent-on-passing>

Usage

```
ahca_polls
```

Format

A data frame with 15 rows representing polls and 7 variables:

start Start date of the poll.

end End date of the poll.

pollster The entity that conducts and collects information from the poll.

favor The number of affirmative responses to the question at the pollster.

oppose The number of negative responses to the question at the pollster.

url The website associated with the polling question.

text The polling question asked at the pollster.

Source

See <https://github.com/fivethirtyeight/data/blob/master/ahca-polls/README.md>

Examples

```
# To convert data frame to tidy data (long) format, run:
library(dplyr)
library(tidyr)
library(stringr)
ahca_polls_tidy <- ahca_polls %>%
  gather(opinion, count, -c(start, end, pollster, text, url))
```

airline_safety	<i>Should Travelers Avoid Flying Airlines That Have Had Crashes in the Past?</i>
----------------	--

Description

The raw data behind the story "Should Travelers Avoid Flying Airlines That Have Had Crashes in the Past?" <https://fivethirtyeight.com/features/should-travelers-avoid-flying-airlines->

Usage

```
airline_safety
```

Format

A data frame with 56 rows representing airlines and 9 variables:

airline airline

incl_reg_subsidiaries indicates that regional subsidiaries are included

avail_seat_km_per_week available seat kilometers flown every week

incidents_85_99 Total number of incidents, 1985-1999

fatal_accidents_85_99 Total number of fatal accidents, 1985-1999

fatalities_85_99 Total number of fatalities, 1985-1999

incidents_00_14 Total number of incidents, 2000-2014

fatal_accidents_00_14 Total number of fatal accidents, 2000-2014

fatalities_00_14 Total number of fatalities, 2000-2014

Source

Aviation Safety Network <https://aviation-safety.net>.

Examples

```
# To convert data frame to tidy data (long) format, run:
library(dplyr)
library(tidyr)
library(stringr)
airline_safety_tidy <- airline_safety %>%
  gather(type, count, -c(airline, incl_reg_subsidiaries, avail_seat_km_per_week)) %>%
  mutate(
    period = str_sub(type, start=-5),
    period = str_replace_all(period, "_", "-"),
    type = str_sub(type, end=-7)
  )
```

antiquities_act *Trump Might Be The First President To Scrap A National Monument*

Description

The raw data behind the story "Trump Might Be The First President To Scrap A National Monument" <https://fivethirtyeight.com/features/trump-might-be-the-first-president-to-scr>

Usage

antiquities_act

Format

A data frame with 344 rows representing acts and 9 variables (Note that 7 of the original rows failed to parse and are omitted here):

current_name Current name of piece of land designated under the Antiquities Act

states State(s) or territory where land is located

original_name If included, original name of piece of land designated under the Antiquities Act

current_agency Current land management agency. NPS = National Parks Service, BLM = Bureau of Land Management, USFS = US Forest Service, FWS = US Fish and Wildlife Service, NOAA = National Oceanic and National Oceanic and Atmospheric Administration

action Type of action taken on land

date Date of action

year Year of action

pres_or_congress President or congress that issued action

acres_affected Acres affected by action. Note that total current acreage is not included. National monuments that cover ocean are listed in square miles.

august_senate_polls

How Much Trouble Is Ted Cruz Really In?

Description

The raw data behind the story "How Much Trouble Is Ted Cruz Really In?" <https://fivethirtyeight.com/features/how-much-trouble-is-ted-cruz-really-in/>.

Usage

august_senate_polls

Format

A data frame with 594 rows representing senate polls, and 11 variables:

cycle the election year

state the state of the poll

senate_class the class of the senate

start_date the start date of the poll

end_date the end odate of the poll

dem_poll the percent of support for the Democrat during the poll

rep_poll the percent of support for the Republican during the poll

dem_result the result percent of support for the Democrat during the election

rep_result the result percent of support for the Republican during the election

error the difference between the percent of support of one party during the poll and the result percent of support for the same party during the election

absolute_error the absolute value of the error value

avengers	<i>Joining The Avengers Is As Deadly As Jumping Off A Four-Story Building</i>
----------	---

Description

The raw data behind the story "Joining The Avengers Is As Deadly As Jumping Off A Four-Story Building" <https://fivethirtyeight.com/features/avengers-death-comics-age-of-ultron/>.

Usage

avengers

Format

A data frame with 173 rows representing characters and 21 variables:

url The URL of the comic character on the Marvel Wikia

name_alias The full name or alias of the character

appearances The number of comic books that character appeared in as of April 30

current Is the member currently active on an avengers affiliated team?

gender The recorded gender of the character

probationary_intro Sometimes the character was given probationary status as an Avenger, this is the date that happened

full_reserve_avengers_intro The month and year the character was introduced as a full or reserve member of the Avengers

year The year the character was introduced as a full or reserve member of the Avengers

years_since_joining 2015 minus the year

honorary The status of the avenger, if they were given "Honorary" Avenger status, if they are simply in the "Academy," or "Full" otherwise

death1 TRUE if the Avenger died, FALSE if not.

return1 TRUE if the Avenger returned from their first death, FALSE if they did not, blank if not applicable

death2 TRUE if the Avenger died a second time after their revival, FALSE if they did not, blank if not applicable

return2 TRUE if the Avenger returned from their second death, FALSE if they did not, blank if not applicable

death3 TRUE if the Avenger died a third time after their second revival, FALSE if they did not, blank if not applicable

return3 TRUE if the Avenger returned from their third death, FALSE if they did not, blank if not applicable

death4 TRUE if the Avenger died a fourth time after their third revival, FALSE if they did not, blank if not applicable

return4 TRUE if the Avenger returned from their fourth death, FALSE if they did not, blank if not applicable

death5 TRUE if the Avenger died a fifth time after their fourth revival, FALSE if they did not, blank if not applicable

return5 TRUE if the Avenger returned from their fifth death, FALSE if they did not, blank if not applicable

notes Descriptions of deaths and resurrections.

Source

Deaths of Marvel comic book characters between the time they joined the Avengers and April 30, 2015, the week before Secret Wars #1.

bachelorette

Bachelorette / Bachelor

Description

The raw data behind the stories: "How To Spot A Front-Runner On The 'Bachelor' Or 'Bachelorette'" <https://fivethirtyeight.com/features/the-bachelorette/>, "Rachel's Season Is Fitting Neatly Into 'Bachelorette' History" <https://fivethirtyeight.com/features/rachels-season-is-fitting-neatly-into-bachelorette-history/>, and "Rachel Lindsay's 'Bachelorette' Season, In Three Charts" <https://fivethirtyeight.com/features/rachel-lindsay-s-bachelorette-season-in-three-charts/>.

Usage

bachelorette

Format

A data frame with 887 rows representing the Bachelorette and Bachelor contestants and 23 variables:

show Bachelor or Bachelorette.

season Which season?

contestant An identifier for the contestant in a given season.

elimination_1 Who was eliminated in week 1.

elimination_2 Who was eliminated in week 2.

elimination_3 Who was eliminated in week 3.

elimination_4 Who was eliminated in week 4.

elimination_5 Who was eliminated in week 5.

elimination_6 Who was eliminated in week 6.

elimination_7 Who was eliminated in week 7.

elimination_8 Who was eliminated in week 8.
elimination_9 Who was eliminated in week 9.
elimination_10 Who was eliminated in week 10.
dates_1 Who was on which date in week 1.
dates_2 Who was on which date in week 2.
dates_3 Who was on which date in week 3.
dates_4 Who was on which date in week 4.
dates_5 Who was on which date in week 5.
dates_6 Who was on which date in week 6.
dates_7 Who was on which date in week 7.
dates_8 Who was on which date in week 8.
dates_9 Who was on which date in week 9.
dates_10 Who was on which date in week 10.

Details

Eliminates connote either an elimination (starts with "E") or a rose (starts with "R"). Eliminations supersede roses. "E" connotes a standard elimination, typically at a rose ceremony. "EQ" means the contestant quits. "EF" means the contestant was fired by production. "ED" connotes a date elimination. "EU" connotes an unscheduled elimination, one that takes place at a time outside of a date or rose ceremony. "R" means the contestant received a rose. "R1" means the contestant got a first impression rose. "D1" means a one-on-one date, "D2" means a 2-on-1, "D3" means a 3-on-1 group date, and so on. Weeks of the show are eliminated by rose ceremonies, and may not line up exactly with episodes.

bad_drivers

Dear Mona, Which State Has The Worst Drivers?

Description

The raw data behind the story "Dear Mona, Which State Has The Worst Drivers?" <https://fivethirtyeight.com/features/which-state-has-the-worst-drivers/>

Usage

bad_drivers

Format

A data frame with 51 rows representing the 50 states + D.C. and 8 variables:

state State

num_drivers Number of drivers involved in fatal collisions per billion miles

perc_speeding Percentage of drivers involved in fatal collisions who were speeding

perc_alcohol Percentage of drivers involved in fatal collisions who were alcohol-impaired

perc_not_distracted Percentage of drivers involved in fatal collisions who were not distracted

perc_no_previous Percentage of drivers involved in fatal collisions who had not been involved in any previous accidents

insurance_premiums Car insurance premiums (\$)

losses Losses incurred by insurance companies for collisions per insured driver (\$)

Source

National Highway Traffic Safety Administration 2012, National Highway Traffic Safety Administration 2009 & 2012, National Association of Insurance Commissioners 2010 & 2011.

bechdel

The Dollar-And-Cents Case Against Hollywood's Exclusion of Women

Description

The raw data behind the story "The Dollar-And-Cents Case Against Hollywood's Exclusion of Women" <https://fivethirtyeight.com/features/the-dollar-and-cents-case-against-holly>

Usage

bechdel

Format

A data frame with 1794 rows representing movies and 15 variables:

year Year of release

imdb Text to construct IMDB url. Ex: <https://www.imdb.com/title/tt1711425>

title Movie test

test bechdel test result (detailed, with discrepancies indicated)

clean_test bechdel test result (detailed): ok = passes test, dubious, men = women only talk about men, notalk = women don't talk to each other, nowomen = fewer than two women

binary Bechdel Test PASS vs FAIL binary

budget Film budget

domgross Domestic (US) gross

intgross Total International (i.e., worldwide) gross
code Bechdel Code
budget_2013 Budget in 2013 inflation adjusted dollars
domgross_2013 Domestic gross (US) in 2013 inflation adjusted dollars
intgross_2013 Total International (i.e., worldwide) gross in 2013 inflation adjusted dollars
period_code
decade_code

Details

A vignette of an analysis of this dataset using the `tidyverse` can be found on CRAN¹ or by running: `vignette("bechdel", package = "fivethirtyeight")`

Source

<http://bechdeltest.com/> and <https://www.the-numbers.com/>. The original data can be found at <https://github.com/fivethirtyeight/data/tree/master/bechdel>.

biopics

'Straight Outta Compton' Is The Rare Biopic Not About White Dudes

Description

The raw data behind the story "'Straight Outta Compton' Is The Rare Biopic Not About White Dudes" <https://fivethirtyeight.com/features/straight-outta-compton-is-the-rare-biopic>
 An analysis using this data was contributed by Pradeep Adhokshaja as a package vignette at <https://fivethirtyeight-r.netlify.com/articles/biopics.html>.

Usage

`biopics`

Format

A data frame with 761 rows representing movies and 14 variables:

title Title of the film.
site Text to construct IMDB url. Ex: <https://www.imdb.com/title/tt1711425>
country Country of origin.
year_release Year of release.
box_office Gross earnings at U.S. box office.
director Director of film.
number_of_subjects The number of subjects featured in the film.

¹<https://CRAN.R-project.org/package=fivethirtyeight/vignettes/bechdel.html>

subject The actual name of the featured subject.

type_of_subject The occupation of subject or reason for recognition.

race_known Indicates whether the subject's race was discernible based on background of self, parent, or grandparent.

subject_race Race of the subject.

person_of_color Dummy variable that indicates person of color.

subject_sex Sex of subject.

lead_actor_actress The actor or actress who played the subject.

Description

The raw data behind the story "The Ultimate Halloween Candy Power Ranking" <https://fivethirtyeight.com/features/the-ultimate-halloween-candy-power-ranking/>.

Usage

```
candy_rankings
```

Format

A data frame with 85 rows representing Halloween candy and 13 variables:

competitorname The name of the Halloween candy.

chocolate Does it contain chocolate?

fruity Is it fruit flavored?

caramel Is there caramel in the candy?

peanutyalmondy Does it contain peanuts, peanut butter or almonds?

nougat Does it contain nougat?

crispedricewafer Does it contain crisped rice, wafers, or a cookie component?

hard Is it a hard candy?

bar Is it a candy bar?

pluribus Is it one of many candies in a bag or box?

sugarpercent The percentile of sugar it falls under within the data set.

pricepercent The unit price percentile compared to the rest of the set.

winpercent The overall win percentage according to 269,000 matchups.

Source

`chess_transfers`*Chess Transfers*

Description

The raw data behind the story "American Chess Is Great Again" <https://fivethirtyeight.com/features/american-chess-is-great-again/>.

Usage`chess_transfers`

Format

A data frame with 932 rows representing international player transfers and 5 variables:

url The corresponding website on the World Chess Federation page which details the transfers of a given year.

id An numeric identifier for the chess player who transferred.

federation The current national federation of the chess player

form_fed The national federation from which the chess player has transferred.

transfer_date The date at which the transfer took place.

`comic_characters` *Comic Books Are Still Made By Men, For Men And About Men*

Description

The raw data behind the story "Comic Books Are Still Made By Men, For Men And About Men" <https://fivethirtyeight.com/features/women-in-comic-books/>. An analysis using this data was contributed by Jonathan Bouchet as a package vignette at https://fivethirtyeight-r.netlify.com/articles/comics_gender.html.

Usage

`comic_characters`

Format

Because of R package size restrictions, only a preview of the first 10 rows of this dataset is included; to obtain the entire dataset (23,272 rows) see Examples below. The preview is a data frame with 10 rows representing characters and 16 variables:

publisher Comic publisher: DC Comics or Marvel

page_id The unique identifier for that characters page within the wikia

name The name of the character

urlslug The unique url within the wikia that takes you to the character

id The identity status of the character (Secret Identity, Public identity, [on marvel only: No Dual Identity])

align If the character is Good, Bad or Neutral

eye Eye color of the character

hair Hair color of the character

sex Sex of the character (e.g. Male, Female, etc.)

gsm If the character is a gender or sexual minority (e.g. Homosexual characters, bisexual characters)

alive If the character is alive or deceased

appearances The number of appearances of the character in comic books (as of Sep. 2, 2014. Number will become increasingly out of date as time goes on.)

first_appearance The month and year of the character's first appearance in a comic book, if available

month The month of the character's first appearance in a comic book, if available

year The year of the character's first appearance in a comic book, if available

date The date of the character's first appearance in a comic book, if available

Source

DC Wikia https://dc.wikia.com/wiki/Main_Page and Marvel Wikia https://marvel.wikia.com/Main_Page. Characters were scraped on August 24, 2014. Appearance counts were scraped on September 2, 2014. The month and year of the first issue each character appeared in was pulled on October 6, 2014.

Examples

```
# To obtain the entire dataset, run the following code:
library(readr)
library(dplyr)
library(tidyr)
library(lubridate)
library(janitor)

# Get DC characters:
comic_characters_dc <-
  "https://github.com/fivethirtyeight/data/raw/master/comic-characters/dc-wikia-data.csv" %>%
  read_csv() %>%
  clean_names() %>%
  mutate(publisher = "DC")

# Get Marvel characters:
comic_characters_marvel <-
  "https://github.com/fivethirtyeight/data/raw/master/comic-characters/marvel-wikia-data.csv" %>%
  read_csv() %>%
  clean_names() %>%
  mutate(publisher = "Marvel")

# Merge two dataset and perform further data wrangling:
comic_characters <-
  comic_characters_dc %>%
  bind_rows(comic_characters_marvel) %>%
  separate(first_appearance, c("year2", "month"), ", ", remove = FALSE) %>%
  mutate(
    # If month was missing, set as January and day as 01:
    month = ifelse(is.na(month), "01", month),
    day = "01",
    # Note some years missing:
    date = ymd(paste(year, month, day, sep = "-")),
    align = factor(
      align,
      levels = c("Bad Characters", "Reformed Criminals", "Netural Characters", "Good Charact
      ordered = TRUE)
    )
  )
```

```
) %>%
  select(publisher, everything(), -c(year2, day))
```

comma_survey	<i>Elitist, Superfluous, Or Popular? We Polled Americans on the Oxford Comma</i>
--------------	--

Description

The raw data behind the story "Elitist, Superfluous, Or Popular? We Polled Americans on the Oxford Comma" <https://fivethirtyeight.com/features/elitist-superfluous-or-popular-we-po>

Usage

```
comma_survey
```

Format

A data frame with 1129 rows representing respondents and 13 variables:

respondent_id Respondent ID

gender Gender

age Age

household_income Household income bracket

education Education level

location Location (census region)

more_grammar_correct In your opinion, which sentence is more grammatically correct?

heard_oxford_comma Prior to reading about it above, had you heard of the serial (or Oxford) comma?

care_oxford_comma How much, if at all, do you care about the use (or lack thereof) of the serial (or Oxford) comma in grammar?

write_following How would you write the following sentence?

data_singular_plural When faced with using the word "data", have you ever spent time considering if the word was a singular or plural noun?

care_data How much, if at all, do you care about the debate over the use of the word "data" as a singular or plural noun?

care_proper_grammar In your opinion, how important or unimportant is proper use of grammar?

Source

See <https://github.com/fivethirtyeight/data/tree/master/comma-survey>.

`congress_age`*Both Republicans And Democrats Have an Age Problem*

Description

The raw data behind the story "Both Republicans And Democrats Have an Age Problem" <https://fivethirtyeight.com/features/both-republicans-and-democrats-have-an-age-problem/>

Usage

`congress_age`

Format

A data frame with 18,635 rows representing members of Congress (House and Senate) and 13 variables:

congress Congress number.

chamber Chamber of congress: House of Representatives or Senate.

bioguide bioguide

firstname First name

middlename Middle name

lastname Last name

suffix Suffix

birthday Birthday

state State abbreviation

party Party abbreviation

incumbent Boolean variable of whether member was an incumbent.

termstart Start date of session.

age Age at start of session.

Source

See <https://github.com/fivethirtyeight/data/tree/master/congress-age>

cousin_marriage *How Many Americans Are Married To Their Cousins?*

Description

The raw data behind the story "How Many Americans Are Married To Their Cousins?" <https://fivethirtyeight.com/features/how-many-americans-are-married-to-their-cousins/>.

Usage

```
cousin_marriage
```

Format

A data frame with 70 rows representing countries and 2 variables:

country Country

percent Percent of marriages that are consanguineous

Source

consang.net

daily_show_guests *Every Guest Jon Stewart Ever Had On 'The Daily Show'*

Description

The raw data behind the story "Every Guest Jon Stewart Ever Had On 'The Daily Show'" <https://fivethirtyeight.com/features/every-guest-jon-stewart-ever-had-on-the-daily-show/>

Usage

```
daily_show_guests
```

Format

A data frame with 2693 rows representing guests and 5 variables:

year The year the episode aired

google_knowledge_occupation Their occupation or office, according to Google's Knowledge Graph or, if they're not in there, how Stewart introduced them on the program.

show Air date of episode. Not unique, as some shows had more than one guest

group A larger group designation for the occupation. For instance, us senators, us presidents, and former presidents are all under "politicians"

raw_guest_list The person or list of people who appeared on the show, according to Wikipedia. The GoogleKnowledge_Occupation only refers to one of them in a given row.

Source

Google Knowledge Graph, The Daily Show clip library, Wikipedia.

Description

The raw data behind the story "Some Democrats Who Could Step Up If Hillary Isn't Ready For Hillary" <https://fivethirtyeight.com/features/some-democrats-who-could-step-up-if-hil>

Usage

democratic_bench

Format

A data frame with 67 rows representing members of the Democratic Party and 3 variables:

candidate Candidate

raised_exp Amount the candidate was expected to raise

raised_act Amount the candidate actually raised

Source

See <https://github.com/fivethirtyeight/data/tree/master/democratic-bench>.

drinks *Dear Mona Followup: Where Do People Drink The Most Beer, Wine And Spirits?*

Description

The raw data behind the story "Dear Mona Followup: Where Do People Drink The Most Beer, Wine And Spirits?" <https://fivethirtyeight.com/features/dear-mona-followup-where-do-people-d>

Usage

drinks

Format

A data frame with 193 rows representing countries and 5 variables:

country country
beer_servings Servings of beer in average serving sizes per person
spirit_servings Servings of spirits in average serving sizes per person
wine_servings Servings of wine in average serving sizes per person
total_litres_of_pure_alcohol Total litres of pure alcohol per person

Source

World Health Organization, Global Information System on Alcohol and Health (GISAH), 2010.

Examples

```
# To convert data frame to tidy data (long) format, run:
library(dplyr)
library(tidyr)
library(stringr)
drinks_tidy <- drinks %>%
  gather(type, servings, -c(country, total_litres_of_pure_alcohol)) %>%
  mutate(
    type = str_sub(type, start=1, end=-10)
  ) %>%
  arrange(country, type)
```

drug_use

How Baby Boomers Get High

Description

The raw data behind the story "How Baby Boomers Get High" <https://fivethirtyeight.com/features/how-baby-boomers-get-high/>. It covers usage of 13 drugs in the past 12 months across 17 age groups.

Usage

drug_use

Format

A data frame with 17 rows representing age groups and 28 variables:

age Age group
n Number of people surveyed
alcohol_use Percentage who used alcohol

alcohol_freq Median number of times a user used alcohol
marijuana_use Percentage who used marijuana
marijuana_freq Median number of times a user used marijuana
cocaine_use Percentage who used cocaine
cocaine_freq Median number of times a user used cocaine
crack_use Percentage who used crack
crack_freq Median number of times a user used crack
heroin_use Percentage who used heroin
heroin_freq Median number of times a user used heroin
hallucinogen_use Percentage who used hallucinogens
hallucinogen_freq Median number of times a user used hallucinogens
inhalant_use Percentage who used inhalants
inhalant_freq Median number of times a user used inhalants
pain_releiver_use Percentage who used pain relievers
pain_releiver_freq Median number of times a user used pain relievers
oxycontin_use Percentage who used oxycontin
oxycontin_freq Median number of times a user used oxycontin
tranquilizer_use Percentage who used tranquilizer
tranquilizer_freq Median number of times a user used tranquilizer
stimulant_use Percentage who used stimulants
stimulant_freq Median number of times a user used stimulants
meth_use Percentage who used meth
meth_freq Median number of times a user used meth
sedative_use Percentage who used sedatives
sedative_freq Median number of times a user used sedatives

Source

National Survey on Drug Use and Health from the Substance Abuse and Mental Health Data Archive <https://www.icpsr.umich.edu/icpsrweb/content/SAMHDA/index.html>.

Examples

```

# To convert data frame to tidy data (long) format, run:
library(dplyr)
library(tidyr)
library(stringr)
use <- drug_use %>%
  select(age, n, ends_with("_use")) %>%
  gather(drug, use, -c(age, n)) %>%

elasticity_by_district

Political Elasticity Scores

Description

This folder contains the data behind the story 'Election Update: The House Districts That Swing The Most (And Least) With The National Mood' <https://fivethirtyeight.com/features/election-update-the-house-districts-that-swing-the-most-and-least-with-the-national-mood/>

Usage

```
elasticity_by_district
```

Format

A dataset with 435 rows representing congressional districts and 2 variables

district congressional district

pvi_538 pvi

Note

The original dataset only has 2 columns: "district" and "elasticity". I separated the "district" columns into two. For example, in row 1 of the dataset, the original "district" = "MI-5", and I separated it into "state" = "Michigan" and "district_number" = "5". In addition, I used the full names for all states instead of abbreviations.

Source

An elasticity score measures how sensitive a state or district it is to changes in the national political environment.

See Also

```
elasticity_by_state
```

Pols And Polls Say The Same Thing: Jeb Bush Is A Weak Front-Runner

Description

The raw data behind the story "Pols And Polls Say The Same Thing: Jeb Bush Is A Weak Front-Runner" <https://fivethirtyeight.com/features/pols-and-polls-say-the-same-thing-jeb-b>

This data includes something we call "endorsement points," an attempt to quantify the importance of endorsements by weighting each one according to the position held by the endorser: 10 points for each governor, 5 points for each senator and 1 point for each representative

Usage

```
endorsements
```

Format

A data frame with 109 rows representing candidates and 9 variables:

year Election year
party Political party
candidate Candidate running in primary
endorsement_points Weighted endorsements through June 30th of the year before the primary
percentage_endorsement_points Percentage of total weighted endorsement points for the candidate's political party through June 30th of the year before the primary
money_raised Money raised through June 30th of the year before the primary
percentage_of_money Percentage of total money raised by the candidate's political party through June 30th of the year before the primary
primary_vote_percentage Percentage of votes won in the primary
won_primary Did the candidate win the primary?

fandango

Be Suspicious Of Online Movie Ratings, Especially Fandango's

Description

The raw data behind the story "Be Suspicious Of Online Movie Ratings, Especially Fandango's" <https://fivethirtyeight.com/features/fandango-movies-ratings/>. contains every film that has a Rotten Tomatoes rating, a RT User rating, a Metacritic score, a Metacritic User score, and IMDb score, and at least 30 fan reviews on Fandango.

Usage

```
fandango
```

Format

A data frame with 146 rows representing movies and 23 variables:

film The film in question

year Year of film

rottentomatoes The Rotten Tomatoes Tomatometer score for the film

rottentomatoes_user The Rotten Tomatoes user score for the film

metacritic The Metacritic critic score for the film

metacritic_user The Metacritic user score for the film

imdb The IMDb user score for the film

fandango_stars The number of stars the film had on its Fandango movie page

fandango_ratingvalue The Fandango ratingValue for the film, as pulled from the HTML of each page. This is the actual average score the movie obtained.

rt_norm The Rotten Tomatoes Tomatometer score for the film , normalized to a 0 to 5 point system

rt_user_norm The Rotten Tomatoes user score for the film , normalized to a 0 to 5 point system

metacritic_norm The Metacritic critic score for the film, normalized to a 0 to 5 point system

metacritic_user_norm The Metacritic user score for the film, normalized to a 0 to 5 point system

imdb_norm The IMDb user score for the film, normalized to a 0 to 5 point system

rt_norm_round The Rotten Tomatoes Tomatometer score for the film , normalized to a 0 to 5 point system and rounded to the nearest half-star

rt_user_norm_round The Rotten Tomatoes user score for the film , normalized to a 0 to 5 point system and rounded to the nearest half-star

metacritic_norm_round The Metacritic critic score for the film, normalized to a 0 to 5 point system and rounded to the nearest half-star

metacritic_user_norm_round The Metacritic user score for the film, normalized to a 0 to 5 point system and rounded to the nearest half-star

imdb_norm_round The IMDb user score for the film, normalized to a 0 to 5 point system and rounded to the nearest half-star

metacritic_user_vote_count The number of user votes the film had on Metacritic

imdb_user_vote_count The number of user votes the film had on IMDb

fandango_votes The number of user votes the film had on Fandango

fandango_difference The difference between the presented Fandango_Stars and the actual Fandango_Ratingvalue

Source

The data from Fandango was pulled on Aug. 24, 2015.

fifa_audience	<i>How To Break FIFA</i>
---------------	--------------------------

Description

The raw data behind the story "How To Break FIFA" <https://fivethirtyeight.com/features/how-to-break-fifa/>.

Usage

```
fifa_audience
```

Format

A data frame with 3652 rows representing guests and 6 variables:

country FIFA member country

confederation Confederation to which country belongs

population_share Country's share of global population (percentage)

tv_audience_share Country's share of global world cup TV Audience (percentage)

gdp_weighted_share Country's GDP-weighted audience share (percentage)

Source

flying *41 Percent Of Fliers Think You're Rude If You Recline Your Seat*

Description

The raw data behind the story "41 Percent Of Fliers Think You're Rude If You Recline Your Seat" <https://fivethirtyeight.com/features/airplane-etiquette-recline-seat/>.

Usage

```
flying
```

Format

A data frame with 1040 rows representing respondents and 27 variables:

respondent_id RespondentID
gender Gender
age Age
height Height
children_under_18 Do you have any children under 18?
household_income Household income bracket
education Education Level
location Location (census region)
frequency How often do you travel by plane?
recline_frequency Do you ever recline your seat when you fly?
recline_obligation Under normal circumstances, does a person who reclines their seat during a flight have any obligation to the person sitting behind them?
recline_rude Is it rude to recline your seat on a plane?
recline_eliminate Given the opportunity, would you eliminate the possibility of reclining seats on planes entirely?
switch_seats_friends Is it rude to ask someone to switch seats with you in order to be closer to friends?
switch_seats_family Is it rude to ask someone to switch seats with you in order to be closer to family?
wake_up_bathroom Is it rude to wake a passenger up if you are trying to go to the bathroom?
wake_up_walk Is it rude to wake a passenger up if you are trying to walk around?
baby In general, is it rude to bring a baby on a plane?
unruly_child In general, is it rude to knowingly bring unruly children on a plane?
two_arm_rests In a row of three seats, who should get to use the two arm rests?
middle_arm_rest In a row of two seats, who should get to use the middle arm rest?
shade Who should have control over the window shade?
unsold_seat Is it rude to move to an unsold seat on a plane?
talk_stranger Generally speaking, is it rude to say more than a few words to the stranger sitting next to you on a plane?
get_up On a 6 hour flight from NYC to LA, how many times is it acceptable to get up if you're not in an aisle seat?
electronics Have you ever used personal electronics during take off or landing in violation of a flight attendant's direction?
smoked Have you ever smoked a cigarette in an airplane bathroom when it was against the rules?

The FiveThirtyEight International Food Association's 2014 World Cup

Description

The raw data behind the story "The FiveThirtyEight International Food Association's 2014 World Cup" <https://fivethirtyeight.com/features/the-fivethirtyeight-international-food-ass>
 For all the countries below, the response to the following question is presented: "Please rate how much you like the traditional cuisine of X"

- 5: I love this country's traditional cuisine. I think it's one of the best in the world.
- 4: I like this country's traditional cuisine. I think it's considerably above average.
- 3: I'm OK with this county's traditional cuisine. I think it's about average.
- 2: I dislike this country's traditional cuisine. I think it's considerably below average.
- 1: I hate this country's traditional cuisine. I think it's one of the worst in the world.
- N/A: I'm unfamiliar with this country's traditional cuisine.

Usage

food_world_cup

Format

A data frame with 1373 rows representing respondents and 48 variables:

respondent_id Respondent ID

knowledge Generally speaking, how would you rate your level of knowledge of cuisines from different parts of the world?

interest How much, if at all, are you interested in cuisines from different parts of the world?

gender Gender

age Age

household_income Household income bracket

education Education Level

location Location (census region)

algeria Cuisine of Algeria

argentina Cuisine of Argentina

Format

A data frame with 248 rows representing performers on TV shows and 15 variables:

performer The name of the actor, according to IMDb. This is not a unique identifier - two performers appeared in more than one program

show The television show where this actor appeared in more than half the episodes

show_start The year the television show began

show_end The year the television show ended, "PRESENT" if the show remains on the air as of May 10.

status Why the actor is no longer on the program: "END" if the show has concluded, "LEFT" if the show remains on the air.

charend The year the character left the show. Equal to "Show End" if the performer stayed on until the final season.

years_since 2015 minus CharEnd

num_lead The number of leading roles in films the performer has appeared in since and including "CharEnd", according to OpusData

num_support The number of leading roles in films the performer has appeared in since and including "CharEnd", according to OpusData

num_shows The number of seasons of television of which the performer appeared in at least half the episodes since and including "CharEnd", according to OpusData

score #LEAD + #Shows + 0.25*(#SUPPORT)

score_div_y "Score" divided by "Years Since"

lead_notes The list of films counted in #LEAD

support_notes The list of films counted in #SUPPORT

show_notes The seasons of shows counted in #Shows

masculinity_survey *Masculinity Survey*

Description

This folder contains the data behind the story: "What Do Men Think It Means To Be A Man?" <https://fivethirtyeight.com/features/what-do-men-think-it-means-to-be-a-man>

Usage

masculinity_survey

Format

A dataset with 189 rows representing answers and 12 variables:

question the survey question

response the survey response

overall the ratio of overall participants who selected this response

age_18_34 the ratio of participants age 18 to 34 who selected this response

age_35_64 the ratio of participants age 35 to 64 who selected this response

age_65_over the ratio of participants age 65 or over who selected this response

white_yes the ratio of overall white participants who selected this response

white_no the ratio of overall non-white participants who selected this response

children_yes the ratio of participants who have child(ren) who selected this response

children_no the ratio of participants who do not have children who selected this response

straight_yes the ratio of straight participants who selected this response

straight_no the ratio of non-straight participants who selected this response

Note

The original ‘masculinity-survey.csv’ contains the results of a survey of 1,615 adult men conducted by SurveyMonkey in partnership with FiveThirtyEight and WNYC Studios from May 10-22, 2018. The modeled error estimate for this survey is plus or minus 2.5 percentage points. The percentages have been weighted for age, race, education, and geography using the Census Bureau’s American Community Survey to reflect the demographic composition of the United States age 18 and over. Crosstabs with less than 100 respondents have been left blank because responses would not be statistically significant. I made heavy editions in Excel to make the dataset easily usable in R.

Source

The original survey responses and original datasets can be found here: <https://github.com/fivethirtyeight/data/tree/master/masculinity-survey>

Examples

```
library(dplyr)
library(ggplot2)
library(tidyr)
library(stringr)

# Data wrangling
masculinity_tidy <- masculinity_survey %>%
  # Narrow down rows to those pertaining to first question of survey:
  filter(question == 'In general, how masculine or "manly" do you feel?') %>%
  # Eliminate columns not relating to sexual orientation:
  select(-c(age_18_34, age_35_64, age_65_over, white_yes, white_no, children_yes,
            children_no, overall)) %>%
  # Convert data frame to tidy data (long) format:
  gather(key = sexuality, value = ratio_by_sexuality, -c(question, response) )
```

```
# Visualize results
ggplot(data = masculinity_tidy, aes(x = response, y = ratio_by_sexuality, fill = sexuality))
  geom_bar(stat="identity", position = 'dodge') +
  labs(x = "Response", y = "Proportion", labs = "Sexuality",
       title = "In general, how masculine or 'manly' do you feel?")

mlb_as_play_talent *The Best MLB All-Star Teams Ever*

Description

The raw data behind the story "The Best MLB All-Star Teams Ever" <https://fivethirtyeight.com/features/the-best-mlb-all-star-teams-ever/>.

Usage

mlb_as_play_talent

Format

A data frame with 3930 rows representing Major League Baseball players in given seasons and 15 variables:

bbref_id Player's ID at Baseball-Reference.com

yearid The season in question

gamenum Order of All-Star Game for the season (in years w/ multiple ASGs; set to 0 when only 1 per year)

gameid Game ID at Baseball-Reference.com

lgid League of All-Star team

startingpos Position (according to baseball convention; 1=pitcher, 2=catcher, etc.) if starter

off600 Estimate of offensive talent, in runs above league average per 600 plate appearances

def600 Estimate of fielding talent, in runs above league average per 600 plate appearances

pitch200 Estimate of pitching talent, in runs above league average per 200 innings pitched

asg_pa Number of plate appearances in the All-Star Game itself

asg_ip Number of innings pitched in the All-Star Game itself

offper9innasg Expected offensive runs added above average (from talent) based on PA in ASG, scaled to a 9-inning game

defper9innasg Expected defensive runs added above average (from talent) based on PA in ASG, scaled to a 9-inning game

pitper9innasg Expected pitching runs added above average (from talent) based on IP in ASG, scaled to a 9-inning game

totper9innasg Expected runs added above average (from talent) based on PA/IP in ASG, scaled to a 9-inning game

Source

mlb_as_team_talent *The Best MLB All-Star Teams Ever*

Description

The raw data behind the story "The Best MLB All-Star Teams Ever" <https://fivethirtyeight.com/features/the-best-mlb-all-star-teams-ever/>.

Usage

```
mlb_as_team_talent
```

Format

A data frame with 172 rows representing Major League Baseball seasons and 16 variables:

yearid The season in question

gamenum Order of All-Star Game for the season (in years w/ multiple ASGs; set to 0 when only 1 per year)

gameid Game ID at Baseball-Reference.com

lgid League of All-Star team

tm_off_talent Total runs of offensive talent above average per game (36 plate appearances)

tm_def_talent Total runs of fielding talent above average per game (36 plate appearances)

tm_pit_talent Total runs of pitching talent above average per game (9 innings)

mlb_avg_rpg MLB average runs scored/game that season

talent_rspg Expected runs scored per game based on talent (MLB R/G + team OFF talent)

talent_rapg Expected runs allowed per game based on talent (MLB R/G - team DEF talent- team PIT talent)

unadj_pyth Unadjusted pythagorean talent rating; $PYTH = (RSPG^{1.83}) / (RSPG^{1.83} + RAPG^{1.83})$

timeline_adj Estimate of relative league quality where 2015 MLB = 1.00

sos Strength of schedule faced; adjusts an assumed .500 SOS downward based on timeline adjustment

adj_pyth Adjusted pythagorean record; $= (SOS * unadj_Pyth) / ((2 * unadj_Pyth * SOS) - SOS - unadj_Pyth + 1)$

no_1_player Best player according to combo of actual PA/IP and talent

no_2_player 2nd-best player according to combo of actual PA/IP and talent

`mlb_elo`*MLB Elo*

Description

The raw data behind the stories: "The Complete History Of MLB" <https://projects.fivethirtyeight.com/complete-history-of-mlb/> and "MLB Predictions" <https://projects.fivethirtyeight.com/2017-mlb-predictions/>.

Usage

`mlb_elo`

Format

Because of R package size restrictions, only a preview of the first 10 rows of this dataset is included; to obtain the entire dataset (1871 to 2017 games) see Examples below. A data frame with 10 rows representing Elo ratings and 26 variables:

date The date of the game.

season The season within which the game was played.

neutral No description provided.

playoff No description provided.

team1 One team that participated in the game.

team2 The other team that participated in the match.

elo1_pre The Elo rating for team1 prior to the game.

elo2_pre The Elo rating for team2 prior to the game.

elo_prob1 No description provided.

elo_prob2 No description provided.

elo1_post The Elo rating for team1 after the game.

elo2_post The Elo rating for team2 after the game.

rating1_pre No description provided.

rating2_pre No description provided.

pitcher1 An identifier of the pitcher

pitcher2 No description provided.

pitcher1_rating No description provided.

pitcher2_rating No description provided.

pitcher1_adj No description provided.

pitcher2_adj No description provided.

rating_prob1 No description provided.

rating_prob2 No description provided.

rating1_post No description provided.

rating2_post No description provided.

score1 The number of runs scored by team1.

score2 The number of runs scored by team2.

Source

See <https://github.com/fivethirtyeight/data/blob/master/mlb-elo/README.md>

`nba_draft_2015`*Projecting The Top 50 Players In The 2015 NBA Draft Class*

Description

The raw data behind the story "Projecting The Top 50 Players In The 2015 NBA Draft Class"

<https://fivethirtyeight.com/features/projecting-the-top-50-players-in-the-2015-nba>

An analysis using this data was contributed by G. Elliott Morris as a package vignette at <https://fivethirtyeight-r.netlify.com/articles/nba.html>.

Usage

```
nba_draft_2015
```

Format

A data frame with 1090 rows representing National Basketball Association players/prospects and 9 variables:

player Player name

position The player's position going into the draft

id The player's identification code

draft_year The year the player was eligible for the NBA draft

projected_spm The model's projected statistical plus/minus over years 2-5 of the player's NBA career

superstar Probability of becoming a superstar player (1 per draft, SPM $\geq +3.3$)

starter Probability of becoming a starting-caliber player (10 per draft, SPM $\geq +0.5$)

role_player Probability of becoming a role player (25 per draft, SPM ≥ -1.4)

bust Probability of becoming a bust (everyone else, SPM < -1.4)

Description

The raw data behind the story 'The Rise And Fall Of Women's NCAA Tournament Dynasties' <https://fivethirtyeight.com/features/louisiana-tech-was-the-uconn-of-the-80s/>

Usage

```
ncaa_w_bball_tourney
```

Format

A dataset with 2092 rows representing every team that has participated in the NCAA Division I Women's Basketball Tournament since it began in 1982 and 19 variables

year the year of the game which the team participated in

school the school of the participating team

seed The '(OR)' seeding designation in 1983 notes the eight teams that played an opening-round game to become the No. 8 seed in each region.

conference the conference record of the team (if available)
conf_w number of winning in conference record
conf_l number of losses in conference record
conf_percent percent of winning in conference record
reg_w number of winning in regular-season record
reg_l number of losses in regular-season record
reg_percent percent of winning in regular-season record
how_qual Whether the school qualified with an automatic bid (by winning its conference or conference tournament) or an at-large bid.
first_home_game Whether the school played its first-round tournament games on its home court.
tourney_w number of winning in tournament record
tourney_l number of losses in tournament record
tourney_finish The round of the final game for each team. OR=opening-round loss (1983 only); 1st=first-round loss; 2nd=second-round loss; RSF=loss in the Sweet 16; RF=loss in the Elite Eight; NSF=loss in the national semifinals; N2nd=national runner-up; Champ=national champions
full_w number of winning in full record
full_l number of losses in full record
full_percent percent of winning in full record

partisan_lean_district

FiveThirtyEight's Partisan Lean

Description

This directory contains the data for FiveThirtyEight's partisan lean, which is used in our [House] <https://projects.fivethirtyeight.com/2018-midterm-election-forecast/house> [Senate] <https://projects.fivethirtyeight.com/2018-midterm-election-forecast/senate> and [Governor] <https://projects.fivethirtyeight.com/2018-midterm-election-forecast/governor/> forecasts.

Usage

partisan_lean_district

Format

A dataset with 435 rows representing votes and 4 variables

state the state of the vote

district_number the district_number of the vote

pvi_party the party of the vote

pvi_amount the Cook Partisan Voting Index of the vote

Note

The original dataset only has 2 columns: "district" and "pvi_538". I separated each of the 2 columns into two. For example, in row 1 of the dataset, the original "district" = "AK-1", and I separated it into "state" = "Arkansas" and "district_number" = "1"; the original "pvi_538" = "R+15.21", and I separated it into "pvi_party" = "R" and "pvi_amount" = "15.21". In addition, I used the full names for all states instead of abbreviations.

Source

Partisan lean is the average difference between how a state or district votes and how the country votes overall, with 2016 presidential election results weighted 50 percent, 2012 presidential election results weighted 25 percent and results from elections for the state legislature weighted 25 percent.

FiveThirtyEight's Partisan Lean

Description

This directory contains the data for FiveThirtyEight's partisan lean, which is used in our [House] <https://projects.fivethirtyeight.com/2018-midterm-election-forecast/house> [Senate] <https://projects.fivethirtyeight.com/2018-midterm-election-forecast/senate> and [Governor] <https://projects.fivethirtyeight.com/2018-midterm-election-forecast/governor/> forecasts.

Usage

partisan_lean_state

Format

A dataset with 50 rows representing states and 3 variables

state the state

pvi_party the party of the vote

pvi_amount the Cook Partisan Voting Index of the vote

Note

The original dataset only has 2 columns: "state" and "pvi_538". I separated the "pvi_538" columns into two. For example, in row 1 of the dataset, the original "pvi_538" = "R+27", and I separated it into "pvi_party" = "R" and "pvi_amount" = "27".

Source

Partisan lean is the average difference between how a state or district votes and how the country votes overall, with 2016 presidential election results weighted 50 percent, 2012 presidential election results weighted 25 percent and results from elections for the state legislature weighted 25 percent.

`police_locals`*Most Police Don't Live In The Cities They Serve*

Description

The raw data behind the story "Most Police Don't Live In The Cities They Serve" <https://fivethirtyeight.com/features/most-police-dont-live-in-the-cities-they-serve/>.

Usage`police_locals`**Format**

A data frame with 75 rows representing cities and 8 variables:

city U.S. city

force_size Number of police officers serving that city

all Percentage of the total police force that lives in the city

white Percentage of white (non-Hispanic) police officers who live in the city

non_white Percentage of non-white police officers who live in the city

black Percentage of black police officers who live in the city

hispanic Percentage of Hispanic police officers who live in the city

asian Percentage of Asian police officers who live in the city

Details

The dataset includes the cities with the 75 largest police forces, with the exception of Honolulu for which data is not available. All calculations are based on data from the U.S. Census.

The Census Bureau numbers are potentially going to differ from other counts for three reasons:

1. The census category for police officers also includes sheriffs, transit police and others who might not be under the same jurisdiction as a city's police department proper. The census category won't include private security officers.
2. The census data is estimated from 2006 to 2010; police forces may have changed in size since then.
3. There is always a margin of error in census numbers; they are estimates, not complete counts.

Note: Missing values means that there are fewer than 100 police officers of that race serving that city.

Source

See <https://github.com/fivethirtyeight/data/tree/master/police-locals>

Examples

```
# To convert data frame to tidy data (long) format, run:
library(dplyr)
library(tidyr)
police_locals_tidy <- police_locals %>%
  gather(key = "race", value = "perc_in", all:asian)
```

An Inconvenient Sequel

Description

The raw data behind the story "Al Gore's New Movie Exposes The Big Flaw In Online Movie Ratings" <https://fivethirtyeight.com/features/al-gores-new-movie-exposes-the-big-flaw-i>

Usage

ratings

Format

Because of R package size restrictions, only a preview of the first 10 rows of this dataset is included; to obtain the entire dataset (80,053 rows) see Examples below. The preview is a data frame with 10 rows representing movie ratings and 27 variables:

timestamp The date at which the rating was recorded.

respondents The number of respondents in a category associated with a given timestamp.

category The subgroups of respondents differentiated by demographics like gender, age, and nationality.

link The website associated with a given category's responses.

average The average rating reported by a given category.

mean The mean rating reported by a given category.

median The median rating reported by a given category.

votes_1 The count of votes denoting a rating of one that respondents gave.

votes_2 The count of votes denoting a rating of two that respondents gave.

votes_3 The count of votes denoting a rating of three that respondents gave.
votes_4 The count of votes denoting a rating of four that respondents gave.
votes_5 The count of votes denoting a rating of five that respondents gave.
votes_6 The count of votes denoting a rating of six that respondents gave.
votes_7 The count of votes denoting a rating of seven that respondents gave.
votes_8 The count of votes denoting a rating of eight that respondents gave.
votes_9 The count of votes denoting a rating of nine that respondents gave.
votes_10 The count of votes denoting a rating of ten that respondents gave.
pct_1 The percentage of votes denoting a rating of one that respondents gave.
pct_2 The percentage of votes denoting a rating of two that respondents gave.
pct_3 The percentage of votes denoting a rating of three that respondents gave.
pct_4 The percentage of votes denoting a rating of four that respondents gave.
pct_5 The percentage of votes denoting a rating of five that respondents gave.
pct_6 The percentage of votes denoting a rating of six that respondents gave.
pct_7 The percentage of votes denoting a rating of seven that respondents gave.
pct_8 The percentage of votes denoting a rating of eight that respondents gave.
pct_9 The percentage of votes denoting a rating of nine that respondents gave.
pct_10 The percentage of votes denoting a rating of ten that respondents gave.

```

Russia Investigation

Description

This folder contains data behind the story 'Is The Russia Investigation Really Another Watergate?' <https://projects.fivethirtyeight.com/russia-investigation/>

Usage

```
russia_investigation
```

Format

A dataset with 194 rows representing every special investigation since the Watergate probe began in 1973 and 13 variables

investigation Unique id for each investigation

investigation_start Start date of the investigation

investigation_end End date of the investigation

investigation_days Length, in days, of the investigation. Days will be negative if the charge occurred before the investigation began.

name Name of the person charged (if applicable). Will be blank if there were no charges.

indictment_days Length, in days, from the start of the investigation to the date the person was charged (if applicable). Days will be negative if the charge occurred before the investigation began.

type Result of charge (if applicable)

cp_date Date the person pled guilty or was convicted (if applicable)

cp_days Length, in days, from the start of the investigation to the date the person pled guilty or was convicted (if applicable)

overturned Whether or not the relevant person's conviction was overturned

pardoned Whether or not the relevant person's charge was pardoned

american Whether or not the relevant person's charge was a U.S. resident

president President at the center of the investigation

Source

Information for this story is drawn from an original data set of special counsel, independent counsel and special prosecutor investigations from 1973 to 2019. The data set was created by consulting historical sources, including final reports generated by independent counsels, special counsels and special prosecutors; reports in Congressional Quarterly; and contemporaneous news stories. Secondary historical sources were also consulted, including a 2006 Congressional Research Service report about independent counsel investigations and a history of the Watergate investigation by Stanley Kutler. Data about pardons was obtained from the Office of the Pardon Attorney. Indicted organizations were excluded from our analysis. The data set, which is available on Github, includes the names of all people charged as part of these investigations, as well as the outcome of their cases and the dates of major actions in their cases.

senate_national_forecast
Senate Forecast 2018

Description

This file contains links to the data behind FiveThirtyEight's 'Senate forecasts' <https://projects.fivethirtyeight.com/2018-midterm-election-forecast/senate/>

Usage

```
senate_national_forecast
```

Format

A dataframe with 450 rows representing national-level results of the classic, lite, and deluxe Senate forecasts since Aug. 1, 2018 and 11 variables

forecastdate date of the forecast

party the party of the forecast

model the model of the forecast

win_probability the probability of the corresponding party winning

mean_seats the mean of the number of seats

median_seats the median number of seats

p10_seats the top 10 percentile of number of seats

p90_seats the top 90 percentile of number of seats

margin unknown

p10_margin the margin of p10_seats

p90_margin the margin of p90_seats

Note

The original dataset included a meaningless column called "state", and all variables under this column was "US". So this column was removed.

 spi_matches

Match-by-match SPI ratings and forecasts back to 2016

Description

The raw data behind the stories "Club Soccer Predictions" <https://projects.fivethirtyeight.com/soccer-predictions/> and "Global Club Soccer Rankings" <https://projects.fivethirtyeight.com/global-club-soccer-rankings/>.

Usage

```
spi_matches
```

Format

Because of R package size restrictions, only a preview of the first 10 rows of this dataset is included; to obtain the entire dataset (30,533 rows) see Examples below. The preview is a data frame with 10 rows representing soccer matches and 13 variables:

date The date that the match took place.

league_id A numerical identifier of the league within which the match was played.

league League name.

team1 One team that participated in the match.

team2 The other team that participated in the match.

spi1 The SPI score of team1.

spi2 The SPI score of team2.

prob1 The probability that team1 would have won the match.

prob2 The probability that team2 would have won the match.

probtie The probability that the match would have resulted in a tie.

proj_score1 The predicted number of goals that team1 would have scored.

proj_score2 The predicted number of goals that team2 would have scored.

importance1

importance2

score1 The number of goals that team1 scored.

score2 The number of goals that team2 scored.

`tarantino`*A Complete Catalog Of Every Time Someone Cursed Or Bled Out In A Quentin Tarantino Movie*

Description

The raw data behind the story "A Complete Catalog Of Every Time Someone Cursed Or Bled Out In A Quentin Tarantino Movie" <https://fivethirtyeight.com/features/complete-catalog-curses-deaths-in-quentin-tarantino-movies/>
An analysis using this data was contributed by Olivia Barrows, Jojo Miller, and Jayla Nakayama as a package vignette at https://fivethirtyeight-r.netlify.com/articles/tarantino_swears.html.

Usage`tarantino`**Format**

A data frame with 1894 rows representing curse/death instances and 4 variables:

movie Film title

profane Whether the event was a profane word (TRUE) or a death (FALSE)

word The specific profane word, if the event was a word

minutes_in The number of minutes into the film the event occurred

Source

See <https://github.com/fivethirtyeight/data/tree/master/tarantino>

`tennis_events_time` *Why Some Tennis Matches Take Forever*

Description

The raw data behind the story "Why Some Tennis Matches Take Forever" <https://fivethirtyeight.com/features/why-some-tennis-matches-take-forever/>.

Usage`tennis_events_time`

Format

A data frame with 205 rows representing tournaments and 5 variables:

tournament Name of event

surface Court surface used at the event

sec_added Seconds added per point for this event on this surface in years shown, from regression model controlling for players, year and other factors

year_start Start year for data used from this tournament in regression

year_end End year for data used from this tournament in regression

tenth_circuit *For A Trump Nominee, Neil Gorsuch's Record Is Surprisingly Moderate On Immigration*

Description

The raw data behind the story "For A Trump Nominee, Neil Gorsuch's Record Is Surprisingly Moderate On Immigration" <https://fivethirtyeight.com/features/for-a-trump-nominee-neil-gorsuch/>

Usage

```
tenth_circuit
```

Format

A data frame with 954 rows representing cases and 13 variables:

title Name of the case

date Date of decision

federalreporter_cit Case citation, as listed in the Federal Reporter Series

westlaw_cit Case citation, Westlaw format

issue Issue number, in cases divided into multiple issues

weight Weight per issue (total weight per case equals one)

judge1 Name of first judge

judge2 Name of second judge

judge3 Name of third judge

vote1_liberal Vote of first judge. 1 = liberal, 0 = conservative.

vote2_liberal Vote of second judge. 1 = liberal, 0 = conservative.

vote3_liberal Vote of third judge. 1 = liberal, 0 = conservative.

category Category of case, immigration or discrimination

Note

In immigration cases, partial relief to immigration petitioner is coded as liberal because the petitioner typically seeks just one core remedy (e.g., withholding of removal, adjustment of status, or asylum); in discrimination cases, partial relief is coded as multiple issues because the plaintiff often seeks separate remedies under multiple claims (e.g., disparate treatment, retaliation, etc.) and different sources of law.

trumpworld_issues *What the World Thinks of Trump*

Description

The raw data behind the story "What the World Thinks of Trump" <https://fivethirtyeight.com/features/what-the-world-thinks-of-trump/>: Trump World Issues Dataset

Usage

```
trumpworld_issues
```

Format

A data frame with 185 rows representing countries and 6 variables:

country The country whose population is being polled

net_approval The difference in the number of respondents from the given country who approve and who disapprove of the issue (Trump proposal) in question (approve-disapprove)

approve The number of respondents from the given country who approve of the issue (Trump proposal)

disapprove The number of respondents who disapprove of the issue

dk_refused undefined

issue The specific trump policy proposal being posed. Specifically: 1: Withdraw support for international climate change agreements 2: Build a wall on the border between the U. S. and Mexico 3: Withdraw U.S. support from the Iran nuclear weapons agreement 4: Withdraw U.S. support for major trade agreements 5: Introduce tighter restrictions on those entering the U.S. from some majority-Muslim countries

trump_approval_poll

How Popular is Donald Trump

Description

The raw data behind the story: "How Popular is Donald Trump" <https://projects.fivethirtyeight.com/trump-approval-ratings/>: Approval Poll Dataset

Usage

```
trump_approval_poll
```

Format

A data frame with 3051 rows representing individual polls and 20 variables:

subgroup The subgroup the poll falls into as defined by the type of people being polled (all polls, voters, adults)

start_date The date the polling began

end_date The date the polling concluded

pollster The polling group which produced the poll

grade The grade for President Trump that the respondents' approval ratings correspond to

sample_size The sample size of the poll

population The type of people being polled (a for adults, lv for likely voters, rv for registered voters)

weight The weight fivethirtyeight gives the poll when determining approval ratings based on historical accuracy of the pollster

approve The percentage of respondents who approve of the president

disapprove The percentage of respondents who disapprove of the president

adjusted_approve The percentage of respondents who approve of the president adjusted for systematic tendencies of the polling firm

adjusted_disapprove The percentage of respondents who disapprove of the president adjusted for systematic tendencies of the polling firm

multiversions True if there are multiple versions of the poll, False if there are not

tracking TRUE if the poll was tracked, FALSE if not

url Poll result URL

poll_id Poll ID number

question_id ID number for the question being polled

created_date Date the poll was created

timestamp Date and time the poll was compiled

Details

Variables "model_date", "influence", and "president" were deleted because each observation contained the same value for these variables: January 5, 2018; 0; and Donald Trump respectively.
